The last use of the word dates from the fourth century. Trench says that the first use of the word in this sense is in an edict of the Emperor Valentinian, A.D. 368. Christianity was first preached in the large towns, and partly on this account and partly from the greater proneness of the people of cities to adopt new opinions, it rooted itself at the great centres of population before greatly affecting the country parts, the cities were then Christian, while the country people were heathen, and the word *paganus* = a villager, consequently became synonymous with heathen (q.v.).]

¶ Used specially of that of ancient Rome. Licinius having made war against Constantine, A.D. 314, and again in 324, after the conversion of the latter to Christianity, was supported by the good wishes and the power of the pagan priests. Constantine believed that paganism was a danger to the throne, and began to discourage it. In 331 he ordered the destruction of the pagan temples throughout the Roman empire. Julian, in 361, began to rebuild them, but the work ceased with his death. In 385 Theodosius I. issued an edict against pagan sacrifices, and soon afterwards closed the temples and the shrines. In 388 the Roman Senate renounced paganism, and in 391 it was legally abolished through the whole Roman empire, and afterwards gradually died away.

1. The temple of an idol in India. They belong both to antiquity and modern times. Some are wonderfully large and magnificent. They consist of one or more quadrangular courts with towers at the corners, surrounded by a wall. Large pyramids rising in stages cover the entrance, behind which extend colonnades. Inside the courts are lustral pools, colonnades, and large halls, called Tschultris, which are used to lodge pilgrimsin. Small side-temples appear with cupolas surmounting the accessory buildings. Behind the first court is often a second and a third, in which, finally, the chief temple stands. Although the architecture of all these constructive designs has no pretensions to artistic or stylic importance, still a wonderfully fantastic effect is produced by a tasteless excess in peculiar ornamentation and architectural features. The most important pagodas are those of Madura, Tanjore, and Chillimbaram. The most celebrated is that of Juggernaut, in the island of Ramiseram, completed towards the end of the twelfth century. All these buildings are of a pyramidal shape, with vertical stages, which are separated by curved roofs and terminate above in the form of a cupola. Rows of small cupolas stand out from the roofs of the stages.

Ord.: A gun invented by General Paixhan in 1822, and introduced into the French service, chiefly for naval use, as the *canon obusier* or shell-gun, in 1824. Previous to this, smoothbore cannon had only fired solid shot, and the objection first raised to Paixhan's system was that his guns could not fire red-hot shot or double shot. His guns were large-bore, chambered weapons, firing hollow shot or shells of large calibre, the latter being usually charged with powder and fired with a time fuze. They were used with great effect by the Russian ships at Sinope, and were afterwards largely used in the English naval service until the introduction of rifled weapons.

palæocrystic-sea, *s.*

Phys. Geog.: (See extract).

"We had long been aware that the ice of which this part of the polar sea was composed consisted of huge massive floes, not of a few seasons' formation, but the creation of ages, real thick-ribbed ice. Except along the west coasts of Banks and Prince Patrick Islands, no such ice had ever before been met with in the Arctic regions. It therefore became desirable to apply to it a special name by which it might be provisionally known. After some discussion, Captain Nares [Dec. 1875] decided upon calling the frozen sea, on the southern border of which we were wintering, the '*Palæocrystic Sea*,' the name being derived from the two Greek words παλαιος, ancient, and κρυσταλλος, ice. This term was used for the great frozen polar sea during the remaining period of our detention on its borders."—*A. H. Markham: Great Frozen Sea*, p. 228.

păl-æ-ō-zō'-ĭc, *a.* [Pref. *palæo-*, and Gr. ζωή (*zōē*) = life, existence.]

Geol.: The term generally applied to the series of strata commencing with the first rocks which have traces of life, and ending with the upper part of the Permian. As the uppermost strata of all are called by some Quaternary, those immediately beneath these Tertiary, and those a stage further down Secondary, one would expect the basal rocks of the series to be called Primary. But unhappily that term was misused in the infancy of geology, being applied to granite, gneiss, &c., in consequence of which, to avoid confusion, it was allowed to become, for a time at least, extinct,—the word palæozoic being substituted in its room. Sir Charles Lyell, however, in his *Student's Elements of Geology*, retained its use, dividing the "Primary or Palæozoic," from beneath upwards into Laurentian or Archæan, Cambrian, Silurian, Devonian, Carboniferous, and Permian (q.v.). Judged by the thickness of the beds, the Palæozoic strata took a vastly longer time to deposit than all the strata which succeeded, from the close of the Permian to the present time. The palæontological break between the Palæozoic and the Secondary rocks is very considerable. (For details see the various divisions of the period.) [Geology, Fossil.]

Pạl-lā'-dĭ-ạn, *a.* [See def.] Pertaining to or devised by Palladio, an Italian architect, born at Vicenza 1518, died 1580.

Palladian-architecture, *s.* A style of architecture introduced by Palladio, and conforming closely to the precepts of Vitruvius. As regards style, it falls under the category of Roman Renaissance, but of rather a confused kind, for he adorned buildings of every kind, and of most varied purposes and arrangement, with classical temple-portals, without taking into consideration their object or the requirements of the building as a whole, so that the order was frequently carried up through several storeys without any reference to its arrangement. The lower storey of palaces built by Palladio, the greater part of which are at Vicenza, is generally of rustic work, whilst the upper storeys have pilasters or a colonnade; occasionally, however, pilasters or arcades are introduced on the ground-floor. The works of Palladio remained for a long period the model for an entire style.

pal-lā'-dĭ-ŭm, *** pal-lā'-dĭ-ŏn,** *s.* [Lat. from Gr. Παλλάδιον (*Palladion*) = the statue of Pallas on which the safety of Troy was supposed to depend; from Παλλάς (*Pallas*), gen. Παλλαδός (*Pallados*) = Pallas or Minerva.]

I. *Ordinary Language:*

1. *Lit.:* In the same sense as II. 1.

2. *Fig.:* That which affords defence, protection, or safety; a safeguard.

"A kind of *palladium* to save the city."—*Milton: Reform. in England*, bk. i.

II. *Technically:*

1. *Class. Antiq.:* A celebrated statue of Pallas or Minerva, on the preservation of which depended the safety of the city of Troy. (*Virgil; Æneid* ii. 166–183.) This circumstance being known to the Greeks during the Trojan war, Ulysses and Diomedes, by the advice and aid of Helenus, son of Priam, climbed secretly by night over the ramparts of Troy, and carried it off.

2. *Chem.:* A tetrad metallic element discovered by Wollaston in 1803. Symbol, Pd; at. wt. 106·6; sp. gr. 12·1. It is found, associated with platiuum and gold, in South America, and is extracted from the gold in which it occurs by fusing with silver, dissolving out the palladium, &c., with nitric acid, removing silver with common salt, and then adding ammonia and hydrochloric acid, which throws down ammonia-chloride of palladium as a yellow powder. This, on ignition, yields the pure metal. It resembles platinum in its malleability and ductility, but is more fusible, less dense, and has a more silvery appearance. It is slightly soluble in concentrated hydrochloric and sulphuric acids, more so in nitric acid, but dissolves freely in nitro-hydrochloric acid. Its surface is blackened by tineture of iodine, which has no effect on platinum. Like platinum, it forms two classes of compounds, viz., palladious compounds, in which it is bivalent, and palladic compounds, in which it is quadrivalent.

3. *Min.:* An isometric native metal, not found pure, but mostly alloyed with a little platinum and iridium. Sometimes found in minute octahedrons, but mostly as grains, with native platinum, in Brazil. Hardness, 4·5–5; sp. gr. 11·3–11·8; lustre, metallic; colour, steel-gray.

palladium-alloys, *s. pl.*

Chem.: Palladium unites with most metals, but few of its alloys are of practical importance. An alloy of one part palladium with 100 parts steel is well adapted for cutting instruments requiring a smooth edge. An alloy of one part silver and nine parts palladium is used by dentists. Its alloys with gold are of a gray or almost white colour.

palladium-bases, *s. pl.*

Chem.: Compounds of palladium with ammonia and ammonio-organic radicals, not known in the free state, but in combination as chlorides and oxides. Chloride of palladamine, $N_2H_6PdCl_2$, is formed by adding ammonia to a solution of palladious chloride. The oxide forms a strong base. The ethyl compound, pallad-ethylamine chloride, $(C_2H_5)_2(NH_2)_2PdCl_2$, is formed by the action of ethylamine on palladious chloride. It becomes dark yellow and crystalline.

Chem.: $C_{16}H_{32}O_2 = C_{15}H_{31}.CO.OH$. Cetylic acid, Ethalic acid, Olidic acid. An acid found in nearly all animal and vegetable fats. It is obtained by saponifying palm oil with potassic hydrate, decomposing the resulting soap, and purifying the separated fatty acid by crystallization from alcohol. It is a colourless, solid body, without taste or smell, insoluble in water, very soluble in alcohol and ether, melts at 62°, and resolidifies on cooling in a mass of leafy crystals. It boils at 268·5°,

under a pressure of 100 mm., and may be distilled almost unchanged. It forms neutral and acid salts called palmitates.

The first two are prepared by heating palmitic acid with glycerin in sealed tubes, and the third by heating a mixture of monopalmitin and palmitic acid to 250° for thirty hours. They are all crystalline fats. Tripalmitin is identical with the natural palmitin of fats, such as palm-oil, from which it may be obtained by repeated crystallization from alcohol and ether.

Archæol.: The generic name for a class of implements consisting of wedges, more or less axe-shaped, having a groove on each side, terminating in a stop-ridge, and with lateral flanges designed to secure a hold on the handle. "Archæologists now generally concur in applying the old Scandinavian term *paalstab*, or its English synonyme *palstave*, to the next class of implements."—*Wilson: Prehistoric Annals of Scotland*, i. 382.

¶ The following extract will show the original meaning of the word, and the proximate date of its introduction into English.

"This term *paalstab* was formerly applied in Scandinavia and Iceland to a weapon used for battering the shields of the enemy, as is shown by passages in the Sagas. Although not strictly applicable to the instrument in question, this designation is now so generally used by the antiquaries of Scandinavia and Germany, that it seems desirable, with the view of securing a fixed terminology, that it should be introduced into the Archæology of England."—*Worsaae: Primeval Antiquities* (ed. A. *As substantive:*

Pathol.: Loss of the power of motion. It is a symptom of disease, usually of apoplexy. The two causes on which it depends are an affection of a nerve or nerves, or a morbid state of the nervous centres, the brain or spinal cord. Under the former head poisoning of nervous matter or any morbid process impairing the nerves or solution of continuity, or pressure may cause it; under the latter, it is due to a morbid state of the centres of the nervous system. The commonest form is hemiplegia, a paralytic stroke on one side or half, which may be complete, profound, or incomplete. The upper and lower extremities, the muscles of mastication, and, when complete, those of the face, on one side of the body, are all affected. Consciousness may not be lost, but the patient cannot stand; no voluntary movements can be performed, sometimes no reflex, involuntary muscular movements, or only those of the lower extremity, are performed, and only partially and painfully. In some cases the eye can be shut, but not opened [Ptosis], owing to paralysis of the third nerve. The brain lesion and the palsy are on opposite sides from the decussation of the pyramidal columns of the *medulla oblongata.* Brown-Sequard has found exceptions to this rule, and also to the body and face being paralyzed on the same side. It is rare in the spinal cord, paraplegia, or palsy of both extremities being the usual form of lesion there. There are six forms: cerebral, spinal, epileptic, choreic, hysterical, and peripheral, their frequency being in the order named. Palsy is uncommon but serious in the young, and most common in advanced life. There are four modes of termination: (1) Death; (2) complete recovery with wasting muscles; (3) partial recovery with rigid muscles; (4) complete recovery. Recovery

begins with the speech, tongue, and face, the lower limb next, and, if at all, a good while after, the nse of the upper limb returns. In hysterical hemiplegia the lower limb, instead of being dragged by a rotatory movement, is usually dragged straight forwards.

These have been carefully studied by Lebert, and named by him *Panhistophyton*; for the reason that in subjects in which the disease is strongly developed the corpuscles swarm in every tissue and organ of the body, and even pass into the undeveloped eggs of the female moth. . . . It is now certain that this devastating cholera-like Pébrine is the effect of the growth and multiplication of the *Panhistophyton* in the silkworm."—*Huxley: Critiques*, pp. 246, 247.

¶ *Commercial panic:* A panic produced in commercial circles, due to various causes affecting public confidence in financial institutions and the stability of business relations. When such a panic occurs a run is usually begun on the banks which severely tests their solvency, commercial enterprise is restricted, manufacture declines, speculation is confined within narrow limits, and a general distrust and undue caution ensue. There have been many such panics within the history of this country, of greater or less stringency. Those of most importance were the great commercial revulsion of 1837–8, the panic of 1857–8, preceding the Civil War, the severe panic season of 1873, whose effects continued for years, and the great revulsion of 1893–4, whose effects still continue.

The invention of the panorama is due to Barker, a portrait-painter of Edinburgh, who obtained a patent for his invention in 1787. Of late years, the verisimilitude of panoramas has been greatly increased. The spectators stand on a central platform, and the painting forms the boundary of a circular building, while the space from the platform to the painting is realistically treated. This has been done with great effect in panoramas of battle-scenes, the foreground being strewn with shattered arms, lay-figures of men and horses, and the juncture of the mass and the painting so skilfully effected, that it is difficult to tell where one ends and the other begins.

păn'-thĕ-ĭzm, *s.* [Pref. *pan-*, and Gr. θεὸς (*theos*) = god; Fr. *panthéisme*; Ger. *pantheismus.*]

Philos.: The view that God and the universe are identical. It was taught in India in the Vedantie system of philosophy, one of the six leading schools of thought, and to this day it is widely accepted, both by the instructed Brahmins and by the common people. Pantheism is believed to have been the creed of various Greek philosophers, as of Anaximander of Miletus (B.C. 610-547), Pythagoras (B.C. 610-547), and Xenophanes (540-500). It was held by John Scotus Erigena, A.D. 874. In the latter part of the twelfth century it was taught by Amalric of Chartres, a dialectician and theologian. Pope Innocent III. forced him to recant his views, notwithstanding which his bones were dug up and burnt in 1209. John, Bishop of Strasburg, in a rescript against the Brethren of the Free Spirit, published in 1317, attributed to them this, among other tenets, "God is formally whatever exists." By many Spinoza is considered to have revived Pantheism, but his teaching in this respect has been misunderstood. [Spinozism.] In the Pantheism of Schelling God is considered as the Absolute Being, revealing Himself in external nature and in human intelligence and freedom, thus closely approaching the dictum of St. Paul, "In him we live, and move, and have our being" (Acts xvii. 28; cf. Col. i. 17). It is noteworthy that the Greek poet (Aratus, *Phænom.* 1-5) quoted by St. Paul is distinctly pantheistic, and his lines might have served for the germ of the better known, but not less beautiful passage in Virgil (*Georg.* iv. 219-227). [See example under Pantheist.]

The principle of the pantograph is all that could be desired in the way of perfection; but it is found in practice, on account of the numerous joints and the necessary imperfections in its mechanical construction, that it is far from being an accurate instrument. The pantograph is principally useful to the draughtsman in enabling him to mark off the principal points in a reduced copy, through which the lines may afterwards be drawn by the usual methods of construction. For this purpose it is found to work successfully.

¶ Dialogue and songs now form an important part of a pantomime. II. *Manuf.:* A material made in thin sheets from a pulp of rags, esparto grass, straw, wood, and other fibres, and used for writing or printing upon, or for wrapping. The name is derived from papyrus, an Egyptian reed, whose stalk furnished the principal material for writing upon to the nations bordering upon the Mediterranean for so many centuries. [Papyrus.] Paper is manufactured principally from vegetable fibre, reduced to a pulp by boiling and mechanical means. Over 400 different materials have been suggested or actually used for paper manufacture, but rags and esparto form the best materials. Old written or printed paper is also extensively used for re-manufacture. The oldest manuscript written

on cotton paper in England is in the Bodleian collection of the British Museum, and bears date 1049. The most ancient manuscript on the same material in the Library of Paris is dated 1050. Up to the beginning of the nineteenth century, all paper was manufactured by hand, in moulds of various sizes. The different kinds of paper manufactured at the present period, for printing, drawing, correspondence, &c., will be found under their proper names. Machine-made paper is manufactured in a continuous sheet, and newspapers of large circulation are printed on webs several miles in length, the paper not being cut until after the printing. paper-money, *s.*

Fin. & Hist.: Paper-money constitutes a pure credit currency, and has come into existence partly because of its greater conveuience, but more particularly to make up for a deficiency or (at times) a total absence of metallic money. Two distinct forms may be noted; one promising redemption in coin and another conveying no such promise. Being practically worthless in its substance, paper-money necessarily derives its utility from the credit of its issuers. Redeemable paper-money is exactly equivalent to the coin in which redemption is promised, both in purchasing power and as a pricing instrument, so long as such promise remains valid or is believed to be so. The mere promise of redemption in coin does not endow a paper currency with stability or exchangeability; this proceeds from general belief in the solvency and good faith of the issuing power. Irredeemable paper-money, *i.e.,* that for which specific redemption in coin is not promised, has never been employed except under severe stress, and has always been complicated, sooner or later, with the project of coin redemption. Nevertheless, it has built up and preserved nations which otherwise must have perished. Its failures are largely referable to wholesale counterfeiting and to subsequent legislation, frequently of the most hostile character, seeking to compel an arbitrary relation with and subordination to certain metals. The experiment of a full legal tender, irredeemable paper currency, entirely free from and independent of complication with the metals, has never yet been tried by an established nation in time of peace. Such a financial method is regarded as unsound and visionary by the whole metallist school, but an intelligent minority amongst economists believe it would succeed, and that its employment might solve many other perplexing economic problems.

Its surface may now be gilt, painted with oil or size colors or varnished. * **păr'-ą-ble**, *a.* [Lat. *parabilis*, from *paro* = to prepare.] Capable of being prepared or procured. (*Boyle: Works*, ii. 134.)

păr'-ą-ble, * **parabole**, *s.* [O. Fr. *parabole*, from Lat. *parabola*, from Gr. παραβολή (*parabolē*) = a comparison, a parable, from παραβάλλω (*paraballō*) = to throw or set beside, to compare: παρά (*paru*) = beside, and βάλλω (*ballō*) = to throw; Sp. & Port. *parabola*; Ger. *parabel*. From the same source come *parable*, *parabola*, *parle* (old form of *parley*), *parole*, *palaver* (q.v.).]

I. A comparison, a similitude; specif., a fable or allegorical relation or representation of something real in life or nature, from which a moral is drawn for instruction. It differs from an apologne, in that it relates or represents things which, though fictitious, might happen in nature.

"Declare unto us the *parable* of the tares."—*Matth.* xiii. 36.

2. An allegorical or mystical saying or expression; a proverb.

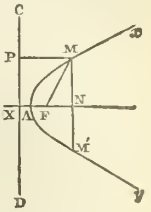
"Unto them that are without all these things are done in *parables*."—*Mark* iv. 11.

¶ Both *parable* and *allegory* imply a veiled mode of speech, which serves more or less to conceal the main object of the discourse by presenting it under the appearance of something else, which accords with it in most of the particulars: the *parable* is mostly employed for moral purposes; the *allegory* in describing historical events. The *parable* substitutes some other subject or agent, who is represented under a character that is suitable to one referred to. In the *allegory* are introduced strange and arbitrary persons in the place of the real personages, or imaginary characteristics, and circumstances are ascribed to real persons.

* **păr'-ą-ble**, *v.t.* [PARABLE, *s.*] To represent in a parable. (*Milton: Doc. Div.*, bk. i., ch. vi.)

pą-răb'-ō-lą, *s.* [Lat., from Gr. παραβολή (*parabolē*), so called from its axis being parallel to the side of the cone; Ger. *parabel*; Fr. *parabole*; Ital. *parabola.*] [PARABLE, *s.*]

Math.: In conic sections, a plane curve of such a form, that if from any point in the curve one straight line be drawn to a given fixed point, the other perpendicular to a straight line given in position, these two straight lines will always be equal to one another. The given fixed point is called the focus of the parabola. The straight line given in position is called the directrix (q.v.). A straight line drawn perpendicular to the directrix, and cutting the curve, is called a diameter, and the point in which it cuts the curve is called the vertex of the diameter. The diameter which passes through the focus is the axis, and the point in which it cuts the curve is the principal vertex. A straight line which meets the curve in any point, but which when produced both ways does not cut it, is called a tangent to the curve at that point. A straight line drawn from any point in the curve, parallel to the tangent at the vertex of any diameter, and terminated both ways by the curve, is called an ordinate to that diameter. The ordinate which passes through the focus is called the parameter of that diameter. The part of a diameter intercepted between its vertex and the point in which it is intersected by one of its own ordinates, is called the abscissa of the diameter. A straight line drawn from any point in the curve, perpendicular to the axis, and terminated both ways by the curve, is called an ordinate to the axis. The ordinate to the axis which passes through the focus is called the principal parameter, or latus rectum, of the parabola. The part of the axis intercepted between its vertex and the point in which it is intersected by one of its own ordinates is called the subtangent of the axis. If a tangent be drawn at any point, and a straight line be drawn from the point of contact perpendicular to it and terminated by the axis, that straight line is called a normal. The part of the axis intercepted between the intersections of the normal and the ordinate is called a subnormal. [DIRECTRIX, TANGENT.]



PARABOLA.

In the parabola XAy PM and MF are the equal lines; F the Focus, CD the directrix, PM and XAF diameters, M and A their vertices, XAF the axis, and A the principal vertex.

V. it is rendered "forest," and in Eccles. ii. 5, and Song of Solomon iv. 13, where it is rendered "orchard." The R.V. translates the first and second "park" and the third "garden," or, on the margin, "paradise." The word, which was of Aryan origin, specially referred to the tree-studded parks around Persian palaces, and the LXX. applied the word παράδεισος (*paradeisos*) to the Garden of Eden. [EDEN.] The word Paradise occurs three times in the A.V. of the New Testament. It was the place to which Jesus and the penitent "thief" (rohber) went the day that they died (Luke xxiii. 43). St. Paul was caught up into it, and identified it with the third heaven (cf. 2 Cor. xii. 2, 4). With analogies still preserved to the earthly Eden, the tree of life is in its midst (cf. Rev. ii. 7 with Gen. ii. 9).

1. *Astron.:* The difference between the position of a heavenly body as viewed from a station on the earth's surface and as it would be if seen from the centre of our planet. It is measured by an angle, of which the point is formed by the heavenly body, whilst the straight lines enclosing it touch the observer's position and the centre of the earth. (*Airy: Pop. Astronomy*, ed. 6th, p. 142.) The parallax of the sun is between 8″ and 9″, and that of the moon about a degree and a half. (*Ibid.*, pp. 209, 210.)

† 2. *Optics:* The difference in the position of an object produced when the wires are not at a proper distance from the object-glass.

¶ (1) *Angle of parallax:*

Optics: The angle formed by two lines drawn from an object, one to the centre of each eye.

(2) *Annual parallax:*

(*a*) The term sometimes applied to a parallax, if any is visible, of a star when viewed from two opposite points of the earth's orbit. The annual parallax of the stars is not in any case certainly 2″, and, in every case but one, unquestionably less than a single second.

(*b*) Sometimes the difference in the position of a star as viewed from the sun and from the earth at the extremity of her orbit; in other words, with a base-line of half her orbit.

(3) *Binocular parallax:*

Optics: The difference between the position of an object as seen with the one eye and with the other, the head remaining unmoved.

(5) *Diurnal parallax:* The same as *Geocentric parallax* (q.v.).

(6) *Geocentric parallax:*

Astron.: The parallax of a heavenly body when in the horizon. The term is specially used of the moon. When in the horizon the parallax is greater than when the moon is in any other position.

(7) *Horizontal equatorial parallax:*

Astron.: As the radii of the earth are not all equal, it is needful to decide which to use in calculating the moon's horizontal parallax. The insertion of the term equatorial means that the equator is the particular radius which has been employed, as it actually is by most astronomers. The moon's horizontal equatorial parallax varies from 54′ to 1°1′15″, the difference arising from the elliptic orbit in which the luminary moves. (*Airy: Pop. Astron.*, p. 165.) The distance of the moon is computed by means of her equatorial horizontal parallax. Theoretically speaking, that of the sun can be ascertained in a similar way; but, the figures being small, a minute error in them would make a great difference in the results of computations founded on them. Hence other methods are adopted. [SUN, TRANSIT.]

(8) *Parallax in altitude:*

Astron.: The parallax of a heavenly body when it has risen to a certain altitude above the horizon.

păr'-ąl-lęl, * **păr'-ą-lęll,** *a.* & *s.* [O. Fr. *parallele*, from Lat. *parallelus*; Gr. *παράλληλος* (*parallēlos*) = parallel, side by side, from *παρά* (*para*) = beside, and * *ἀλλήλος* (*allēlos*) = one another; Sp. *paralelo*; Ital. *parallelo*, *paralello.*]

Geol.: Three roads parallel to each other and perfectly horizontal, existing at exactly the same elevation (150, 200, and 1,250 feet above the sea level), along opposite sides of Glen Roy, in Inverness-shire, ten miles north of Fort William. Dr. Buckland, Macculloch, Agassiz, Sir T. Dick Lauder, Mr. Darwin, Mr. Milne Holme, Prof. Rogers, Sir Robt. Chambers, Mr. Jamieson, Sir Chas. Lyell, Rev. R. B. Watson, Sir John Lubbock, Prof. Babbage, &c., have all attempted to solve the problem of the roads. They were probably made by water, which, during the elevation of the land, stood for long periods at the three successive levels. Some contend that the water which produced them was that of a lake, perhaps a glacier lake, others that of the ocean. Sir John Lubbock advocates the former view, and considers that the waves would throw the materials which they moved in a downward direction. (*Geol. Soc. Trans.*, iv. 314; *Quar. Journ. Geol. Soc.*, xviii. 235, xx. 9, xxiv. 83, 273, xxv. 282.)

pa-răm'-ĕ-tĕr, *s.* [Pref. *para-*, and Eng. *meter.*]

Math.: A name given to a constant quantity entering into the equation of a curve. The term is principally used in discussing the conic sections. In the parabola the parameter of any diameter is a third proportional to the abscissa and ordinate of any point of the curve, the abscissa and ordinate being referred to that diameter and the tangent at its vertex. In all cases the parameter of any diameter is equal to four times the distance from the focus to the vertex of the diameter. The parameter of the axis is the least possible, and is called the parameter of the curve. In the ellipse and hyperbola, the parameter of any diameter is a third proportional to the diameter and its conjugate. The parameter of the transverse axis is the least possible, and is called the parameter of the curve. In all of the conic sections, the parameter of the curve is equal to the chord of the curve drawn through the focus, perpendicular to the axis. The parameter of a conic section and the foci are sufficient data for constructing the curve.

The roots of the more highly organized parasites penetrate the substance of the herb, at whose expense they feed, and take up from it nutrient substances already in large measure assimilated. The lower parasites, by means of their cells, penetrate other cells to live in and on them. The former are more destructive to the plant.

2. *Min.:* A plumose variety of boracite (q.v.) occurring in the interior of crystals of the same, and resulting from their partial alteration.

3. *Zool.:* An animal which lives in, on, or at the expense of the actual substance of another. There is scarcely any animal which does not play the part of host to numerous parasites, and a very large number of the lower Invertebrata are parasitic at some stage of their existence. Parasites may enter the system in the following ways:

(1) Through the medium of food or drink.
(2) Eggs are transferred from one animal to another by actual bodily contact, *e.g.*, the eggs of Pentastomum by the licking of dogs.
(3) Eggs are deposited in or on the host, as is the case with those of the Œstridæ.

Van Beneden divided Parasites into three classes: (1) Parasites proper, living at the expense of the organic substance of the bosts, as the tapeworm; (2) Commensals, who live with, or on, but not at the expense of their hosts, as sea anemones often live on shells of hermit-crabs, and come in for a share of their prey; and (3) Mutualists, a class not clearly defined, and now generally abandoned. Leuckhart divided Parasites into Ecto- and Endo-parasites, according as they lived on, or within, their hosts. Of the latter, by far the larger number belong to the type Vermes. Vertebrate parasites are rare, but exist among the Pisces. Myxiue (the Hag-fish or Borer) penetrates the abdominal cavity of Gadoids, and feeds on their flesh; the species of Fierasfer, Encheliophis, and Echeneis, and some Siluroids, are commensals rather than true parasites.

"The special *parasites* of man are estimated by Cobbold at as many as 121 species (13 Trematodes, 16 Cestodes, 21 Nematoids, 10 Leeches, 17 Arachnids, 44 Insects); many of these, especially among insects . . . have occurred only very rarely, and should not be reckoned; while a considerable number of the truly parasitic forms have been only once or twice described—the above estimate thus becoming reduced well-nigh to half."—*Encyc. Brit.* (ed. 9th), xviii. 250.

1. The skin of a very young calf, sheep, or goat, dressed and prepared for writing on, &c. The grain surface is then removed with a knife and the skin pumiced, if necessary, to give it an equal thickness. Fine parchment is manufactured from the skins of young calves, kids, lambs; also from sheep and goat skins. Extra fine, thin parchments are made from the skins of still-born lambs, kids, and calves. August, 1858; and Mr. Wm. Trail, of the Geological Survey of Ireland, when at Strangford in County Down, saw three brilliant suns in the same horizontal line, and of equal brightness. He thus describes the phenomenon:

"The two outer or mock-suns gradually assumed the prismatic colours, and lengthening out, joined above, thus forming the 'ordinary halo,' in which the red colour was nearest to the real sun. Concentric and exterior to it was another prismatic halo, the 'extraordinary halo,' which was rather fainter, in which also the red colour was innermost. Touching this latter externally was the 'circumzenithal halo,' which was by far the most brilliant of the three, lying as if horizontally overhead. In this, likewise, the red colour was next the sun, this forming the outer periphery of the halo. The phenomenon began a little after two P.M., and lasted only for about half an hour, attaining its greatest spleudour at 2.20 P.M."—*Brit. Assoc. Rep.*, 1871, ii. 56.

¶ The origin of parishes is lost in antiquity, some believe they were of civil, but the majority that they were of ecclesiastical origin. Christianity established itself first at the leading centres of populations, whence it put forth missionary efforts in every direction. Many subordinate churches in each place thus arose around the mother church, and tended slowly to become more independent, having assigned to them a district within which to operate, after which financial endowments would follow. Many lords of manors built and endowed churches for their dependents, and to this day manors and parishes are in many places conterminous. In the early ages a parish was a bishop's as distinguished from an archbishop's see, but when the former was gradually parcelled out into smaller portions these latter began to be called parishes. Camden says that England was divided into parishes by Honorius, the second Archbishop of Canterbury (circ. A.D. 630), but Selden has shown that long after this the clergy lived in common, and were not separately located in parishes. Bede, about A.D. 700, mentions the lay foundation of parishes, and they are alluded to in the laws of King Edgar (A.D. 970). Mr. Topley, F.G.S. (*loc. cit.*) gives topographical reasons for believing—

"That whatever may have been the origin of manors or parishes as such, they both depend upon still older divisions of the land, and that these were not formed by the arbitrary act of church or king, but resulted necessarily from the great physical features of the country."—*Brit. Assoc. Rep.* (1872), ii. 197.

By the time of Pope Nicholas's taxation (A.D. 1288) the country parishes were settled as they remained till the Reformation. In 1520 there were 9,047; and in 1884 in England about 13,500. In the United States there are no civil parishes, except in the State of Louisiana. A church district frequently bears this title.

An English parish is not merely an ecclesiastical division, it is also an area for local government in matters civil, and is the smallest unit recognized for that purpose. For its officers, see Parish-officers. Of these the overseers impose rates for the relief of the poor, for maintaining the roads, the police, for sanitary purposes, &c. In some cases the parish is self-governed for certain of these purposes, but more generally it forms part of a union (q.v.). [QUOAD SACRA.]

(1) *The English Parliament.* [(2.)]

(2) *The Imperial Parliament:* The legislature of the United Kingdom of Great Britain and Ireland, consisting of the Sovereign and the Houses of Lords aud Commons. It arose long prior to the union of the kingdoms as the English Parliament. The first use of the word parliament in the statutes of England is in the preamble to the Statute of Westminster, A.D. 1272. The germ of the institution existed, however, loug before the name arose. Each of the kingdoms of the Saxon heptarchy, or octarchy, seems to have had its wittena-gemote, or meeting of wise men, which, on the union of the several kingdoms, became united into one great assembly or council. In Edward the Confessor's law *de Apibus*, a tenth is confirmed to the Church by the king, the barons, and the people. The laws and charters of the early Norman kings mention only abbots, barons, &c. In 1176 there was a council of bishops, earls, barons, knights, and men. Writs A.D. 1266 are still extant summouing knights, citizens, and burgesses to Parliament. The statute 2 Edward II. (1322) recognises Parliament as having for some time existed, and with a constitution essentially the same as now. The powers of Parliament are very great. Not merely can it destroy any ministry, it can alter, and has in fact altered, the succession to the throne. At the Reformation it transferred property enjoyed by the Church of Rome and altered the national religion, endowing Protestantism with money given for Roman Catholic purposes. Parliament is called together by the sovereign, who appoints the time and place of meeting, and opens the proceedings by the delivery of a speech, e'ther personally or by deputy. Each house can adjourn, but neither can be prorogued except by the sovereign. Each judges of its own privileges. Members of both houses are free from arrest or imprisonment on civil actions, but their property can be seized for debt. No quorum is needed for the transaction of business in the Upper House; forty is the qnorum in the Lower. [Franchise-bill, Commons, Lords, Reform.]

(3) *French Parliament:* A parliament arising about 987. It met at different places. In 1190 Philip Angustus instituted the Parliament of Paris. In 1302 it was divided into three chambers. It was suppressed in 1771, revived in 1774, demanded a meeting of the States-General in 1787, and was superseded by the National Assembly Nov. 3, 1789. A French parliament still exists, but not the name.

(4) *Irish Parliament:* A parliament held in Ireland when it was an independent country. In 1295 writs for knights of the shires were issued. It met for the last time on Aug. 2, 1800, the union with Great Britain having terminated its existence. [Parnellite.]

(5) *Scottish Parliament:* A parliament held in Scotland when it was an independent country. It has been traced back to a council held at Scone under the auspices of John Balliol, in 1292. There was but a single house, consisting of lords temporal and spiritual, occasionally with burgesses. Having passed the Act of Union with England on Jan. 16, 1707, its last meeting took place on April 22 of that year.

parr, *s.* [Etym. douhtful; cf. Gael. and Ir. *bradan* = a salmon. (*Mahn.*)]

Ichthy.: The popular name of what was formerly believed to be a distinct salmonoid species, *Salmo salmulus*, but is now known to be the young of the salmon.

"Shaw has demonstrated, in the most conclusive manner, that those small salmonoids, which are generally called *Parr*, are the offspring of the salmon, and that many males, from seven to eight inches long, have their sexual organs fully developed, and that their milt has all the impregnating properties of the seminal fluid of a much older and larger fish. That this *Parr* is not a distinct species—as has been again maintained by Couch—is further proved by the circumstance that these sexually mature *Parr* are absolutely identical in their zoological characters with the immature *Parr*, which are undoubtedly young salmon, and that no *Parr* has ever been found with mature ova."—*Günther: Study of Fishes*, p. 639.

Ichthy: Dark cross-hands on the young of the species of the genus Salmo.

"In some waters River-trout remain small, and frequently retain the *parr-marks* all their lifetime; at certain seasons a new coat of scales overlays the *parr-marks*, rendering them invisible for a time; but they reappear in time, or are distinct as soon as the scales are removed."—*Günther: Study of Fishes*, p. 632.

Ornith.: The typical genus of Parrinæ (q.v.). [Jacana.]

păr′-rą-keĕt, păr′-ą-keĕt, *s.* [Fr. *perroquet.*]

Ornith.: A popular name for any of the smaller long-tailed parrots. The word is in common use, but is applied without any strict scientific limitation to birds of different genera, and even of different families. Generally speaking, any old-world parrot with a moderate bill, long and more or less graduated tail, with the ends of the feathers narrowed, and high and slender tarsi, is called a parrakeet. The Crested Parrakeet, or Parrakeet Cockatoo, is *Nymphicus novæ-hollandiæ;* the genus Platycercus contains the Wide-tailed Parrakects, and *Platycercus caledonicus* and *P. eximius* are known respectively as the Yellow-bellied, and the Rose or Nonpareil Parrakeet, sometimes called the Rosella Parrot. *Pezoporus formosus* is the Ground Parrakeet, and Grass Parrakeet is a popular name for the Australiau genus Melopsittacus. *Palæornis torquatus*, the Rose-ringed Parrakeet, is a familiar cage-bird, as is the Alexandrine Parrakeet (*Palæornis alexandri*), so named from the supposition that it was brought to Europe by Alexander the Great. It was well known to the Greeks and Romans, and Ovid has described it in one of his daintiest Elegies (*Am.* ii. 6).

"*Parakeet* (spelt in various ways in English), is usually applied to the smaller kinds of Parrots, especially those which have long tails, not as *perroquet* in French, which is used as a general term for all Parrots."—*Encyc. Brit.* (ed. 9th), xviii. 321.

II. *Technically:*

1. *Ornith.:* The popular name for any individual of a well-known group of birds from the warmer regions of the globe, remarkable for the brilliant, and in some cases gaudy, coloration of their plumage, and the facility with which many of them—notably the genera Chrysotis, Palæornis, and Psittacus—acquire and repeat words and phrases. [For some remarkable instances, see *W. L. Lindsay: Mind in the Lower Animals, passim.*] The first known mention of parrots occurs in Ctesias, a Greek historian of the fifth century B.C., who describes a bird which he calls *βίττακος* (*bittakos*), concerning which Prof. Newton (*Encyc. Brit.*, ed. 9th, xviii. 321) says: "There cannot be much risk in declaring that he had before him a male example of what is now commonly known as the Blossom-headed Parrakeet, and to ornithologists as *Palæornis cyanocephalus*, an inhabitant of many parts of India." (The classification of the Parrots is unsettled, and will be dealt with under PSITTACI, which division has been made an order, a sub-order, and a family by different taxonomists.) Many parrots are familiar cage-birds everywhere; but probably the best known is the African Grey Parrot (*Psittacus erythacus*), of simple bluish-gray plumage with a red tail. It accommodates itself readily to captivity, and attains a great age. The Parrots embrace a number of widely divergent forms, from the gorgeously plumaged macaws to the soberly clad owl-parrot, and they differ no less in their habits than in their outward appearance; for while the majority are fruit-eaters, some are honey-eaters, and one species is said, on the authority of Dr. Buller (*Birds of New Zealand*), to be carnivorous. [COCKATOO, MACAW, PARRAKEET.]

"The almost universal distribution of *Parrots* wherever the climate is sufficiently mild or uniform to furnish them with a perenuial supply of food, no less than their varied details of organization, combined with a great uniformity of general type, tell us, in unmistakable language, of a very remote antiquity."—*Wallace: Geog. (*Blackstone.*)]

1. The priest of a parish or ecclesiastical corporation; the vicar or incumbent of a parish, having the parochial charge or cure of souls. To constitute a parson four requisites are necessary by law, viz., holy orders, presentation, institution, and induction. The parson is in himself a body corporate, in order to protect and defend the rights of the church by a perpetual succession. A parson has, during his life, the freehold in himself of the parsonage-house, the glebe, the tithes, and other dues. A parson or vicar may cease to be so, (1) by death; (2) by cession, in taking another benefice; (3) by consecration, for when a clerk is promoted to a bishopric, all his other preferments are void the instant that he is consecrated; (4) by resignation, accepted by the ordinary; (5) by deprivation, for fit and sufficient causes allowed by the law.

2. In the same sense as II.

II. *Gram.:* A part of speech, so called because it partakes of the nature both of a verb and an adjective. A participle differs from an adjective in that it implies the relation of time, and therefore is applied to a specific act, while the adjective denotes only an attribute as a quality or characteristic without regard to time. Thus, in *I have written a letter*, *written* is a participle denoting a specific act done at a certain time; but in *a written letter*, *written* is an adjective. There are two simple participles in English, the present (or imperfect active) and the past (or passive). The former now ends in *-ing*, the latter in *-ed*, *-d*, or *-t*, in the case of weak verbs; in the case of strong verbs the past participles all once ended in *-en* or *-n*, as in *know, known, sow, sown*, but in very many cases this suffix has been dropped, in many other instances verbs originally strong have adopted a weak form for the past tense and past participle, as in *sweep, swept* (orig. *swápen, swepen*), *crow, crowed* (orig. *crâwen, crown*), &c. In such sentences as *seeing is believing*, the termination *-ing* is not that of the present participle, but represents the A.S. verbal termination *-ung*, as in *showing* = A.S. *sceawung.*

Many ot the states bave tbeir special legislation in regard to partnership, some of tbem having a limited liability law, under which each partner of a company is liable only to the amount of his share in the capital stock. A partnership may be limited to one venture or to one branch of business without including any other ventures or branches of business entered into by any of the partners. A partnership may be entered into for a definite time or a specific trausaction, or may be left indefinite to be dissolved by mutual agreement between the partners. Partners are known as active or ostensible when they take an active part in the conduct of the business as principals; as dormant or sleeping when they do not take any active part, but are merely passive in the firm; and as nominal, when they allow their names to be used, and so are held out to the world as partuers, although having no actual interest in the conduct of the business or its profits. Under Scots law, a partnership is a distinct personage, so that in actions brought by or against it the names of the individual partners need not be given. The term is not now used in this sense, but the tolling of a bell at deaths and funerals is a relic of the custom.

Passion-music, *s.* Music set to the narrative of our Lord's Passion in the Gospels. Dramatic representations of the subject date from a very early period, there being still extant a play ascribed, though somewhat doubtfully, to Gregory Nazianzen, Bishop of Antioch. The dramatic performance of the Passion arose in imitation of the ancient custom, still observed in the Roman Church, of dividing the recital of the Gospel of the Passion in Holy Week between two, three, or more readers, assigning those parts which reproduce the words of the people (*turba*) to the congregation or choir. To one priest was assigned the part of Jesus; to others those of Pilate, Judas, &c. All these parts were recited according to the rules of the *accentus ecclesiasticus*, while the people's part was delivered in monotone. Some of the best known settings are by Bach.

pass'-mĕnt, *s.* [PASSEMENT.]

pass'-ō-vĕr, *s.* [Eng. *pass,* v., and *over.*] [PASCH.]

1. *Judaism:*

(1) A festival instituted to commemorate Jehovah's "passing over" the Israelite houses while "passing through" those of the Egyptians, to destroy in the latter all the first-born (Exod. xii. 11, 12, 23, 27). The first passover (that in Egypt), those subsequently occurring in Old Testament times, and those of the New Testament and later Judaism, were all somewhat different. In the first of these a lamb without blemish was taken on the tenth, and killed on the fourteenth, of the month Abib, thenceforward in consequence to be reckoned the first month of the ecclesiastical year. The blood of the lamb was to be sprinkled on the two side-posts and the single upper door-post, and the flesh eaten "with unleavened bread and bitter herbs" before morning (Exod. xii. 1–13). That night Jehovah, passing over the blood-stained doors, slew the firstborn in the Egyptian houses not similarly protected; and, as the emancipated Jews that night departed from Egypt, that first passover could have continued only one day. But the festival was to be an annual one. Connected with it was to be a feast of unleavened bread, continuing seven additional days, viz., from the fifteenth to the twenty-first of Abib, during which no leaven was to be eaten, or even allowed to be in the house (Exod. xii. 14–20; Num. xxviii. 16). [UNLEAVENED.] Sometimes the term passover is limited to the festival of the fourteenth of Abib; sometimes it includes that and the feast of unleavened bread also, the two being viewed as parts of one whole (Ezek. xlv. 21). When the Jews reached Canaan, every male was required to present himself before God thrice a year, viz., at the passover, or feast of unleaveued bread, at that of "harvest," and that of "ingathering" (Exod. xxiii. 16). The designations of the secoud and third suggest that the first also marked a stage in the agricultural year. It was, in fact, the spring-festival (Deut. xvi. 9), held about the time when the first barley was ripe. In the Old Testament six passovers are mentioned as having been actually kept: that in Egypt (Exod. xii. 21–28), that in the wilderness (Num. ix. 1–14), that under Joshua at Gilgal (Joshua v. 10), that under Hezekiah (2 Chron. xxx.), that under Josiah (2 Chron. xxxv.), and that under Ezra (Ezra vi.). After the exile wine was introduced, and is still used (cf.

Matt. xxvi. 17, 27, &c). In modern Judaism no lamb is sacrificed, but the shank bone of a shoulder of that animal is eaten, leaven put away, and other ceremonies observed.

(2) The paschal lamb (Exod. xii. 11; 2 Chron. xxx. 15; John xviii. 28)

2. *Christianity:* Using passover in the sense of the paschal lamb, St. Paul applies the term to Christ, of whose death that of the paschal lamb was typical (1 Cor. v. 7; cf. John xix. 14). [EASTER.]

Church Hist.: The name given to those persons who took part in certain risings in France in the thirteenth and fourteenth centuries. It is probable that these outbreaks, of what Blunt calls "religious Jacquerie," were due in a large degree to the sufferings of the peasantry from the exactions of the nobility, and that the hostility displayed to the clergy was a consequence of their connection with the aristocracy. These outbreaks took place—

1. In Berry in 1214. The peasantry pillaged chateaux and religious houses, and proclaimed universal equality and the coming of the Holy Ghost. (*Larousse.*)

2. In 1250; the ostensible objects were the rescue of Louis VII. and the recovery of the Holy Sepulchre. The rising originated in Flanders, under the leadership of a person of unknown name called the Master of Hungary, who, when he reached Paris, was at the head of 100,000 men. Here "they not only usurped priestly functions, performed marriages, distributed crosses, offered absolution to those who joined the crusade, but they inveighed against the vices of the priesthood." (*Blunt.*) They separated into three divisions, and marched southwards, where they were attacked and cut to pieces.

3. In 1320, in the reign of Philip V. This outbreak took place under the pretence of a crusade. The insurgents were excommunicated by Pope John XXII.; and being hemmed in in Carcassonne, numbers perished of disease and famine, and the survivors were put to death.

B. *As subst.:* A patent, as ordinarily understood, is a grant of the exclusive right of making, using, and selling some new invention, though the meaning of letters-patent, or "open letters," has a much wider application, titles of honor, appointments to certain offices, &c., being thus given. The patenting of inventions began at an early date, and may be traced back in English history as early as the reign of Edward III. In the United States patents were occasionally issued during colonial days, and the Constitution vests in Congress full power to secure "for limited times to authors and inventors the exclusive right to their respective writings and discoveries." An act regulating the issue of patents to inventors was passed in 1790. This law held good until 1836, when a new law was passed providing for a strict examination of claims and other needed reforms. At present, the general principles of the law are the same as in England, but patents are granted for seventeen years, while fourteen years are the limit in England. The number of patents issued in the United States greatly exceeds that of any other country, the people being noted for their inventive genius. In 1840 the number issued was about 500. In 1890 it had reached the annual total of about 25,000. In the century since the passage of the original law about 500,000 patents have been issued. In England, up to 1852, about 500 patents were granted annually, but the number has now greatly increased. The Patent Office is a part of the Department of the Interior. The minimum expense of procuring a patent is about $60, but it may be much increased by legal and other fees, it being usual to procure the assistance of patent lawyers. In England the obtaining and holding a patent is a more costly and difficult process, there being taxes demanded which amount to £150.

II. *Hist.:* Whoever under the old Roman Empire built a temple to a god had the right of nominating the officiating priests, and, in the reign of Constantine, to induce wealthy men to found Christian churches the same privilege of patronage was transferred to them. In Britain, as well as elsewhere, the system prevailed, and when a gentleman built a church on his own estate, he was, as a rule, the patron. (*Blackstone: Comment.,* bk. ii., ch. 3.) [Advowson.] During the centuries when Papacy was dominant much progress was made in substituting clerical for lay patronage. [Investiture.] Most of the reformed churches owing much to powerful noblemen and princes, who had assisted them at times by force of arms in achieving liberty of worship, allowed them to continue, or to restore lay patrouage. In Scotland it was opposed by the two books of discipline in 1560 and 1571, was swept away in 1649, restored in 1660, again abolished in 1689, and restored in 1712. It led to two secessions in the eighteenth century, and to the Disruption of 1843. The Act 37 & 38 Vict. c. 82 once more abolished it, compensation being accorded to the patrons and the right of electing a minister given to the communicants of the congregation. In the Church of England opposition to the sale of advowsons has recently arisen, and appears as if before long it would become a power. If the advowson of a parish descends to a Roman Catholic he is not allowed to put it in force.

By the ordinary process of cupellation, it does not pay to treat lead containing less than twenty ounces of silver to the ton for the purpose of extracting the silver, but by Pattinson's process that containing as little as three ounces per ton may be profitably worked. This process is based on the fact that the melting-points of alloys of silver and lead are higher in proportion to the amount of silver contained, and that if lead containing silver be melted and constantly stirred while gradually cooling, when it arrives at a temperature near the melting-point of lead, crystals will begin to form, which sink to the bottom, leaving the still fluid portion much richer in silver than the whole mass originally was, while, on the contrary, the crystallized portion has become poorer.

B. *As substantive:*

Church Hist. (*Pl.*): A Manichæan sect of Asiatic origin, who appeared in Armenia in the seventh century. They owed their name to a mythical founder, or to their claim to "a monopoly of the pure doctrine of the Apostle of the Gentiles." (*Blunt.*) From the close of the seventh to the middle of the ninth century, they suffered severe persecution, notably under the regency of Theodora (841–857), who did her best to extirpate them: no less than 100,000 are said to have perished from her attempts to carry out her design. Blunt (*Dict. Sects*) thus summarises their doctrines:

"They taught the essential evil of matter, the eternal hostility of the two principles; they denied the inspiration of the Old Testament and the Deity of Jehovah; they despised the Cross; and, holding the Valentinian doctrine that the spiritual Christ passed through the body of the Virgin like water through a pipe, were naturally accused of insulting her memory; they taught a purely illusory baptism, and had no Eucharist; they excluded their ministers or scribes from all government in their community; above all they were iconoclasts, and placed the Scriptures in the hands of the laity."

Pauline-epistles, *s. pl.*

New Test. Canon: Fourteen epistles of the New Testament, thirteen of which commence with St. Paul's name, the fourteenth opening abruptly without any intimation as to the writer, though the detatched title "The Epistle of Paul," has been prefixed to it. Its author was more probably Apollos than Paul. [HEBREWS.] Of the other thirteen, five (Romans, Ephesians, 1 and 2 Timothy, and Titus) have only St. Paul's name attached; four (2 Corinthians, Philippians, Colossians, and Philemon) are from Paul and Timothy; two (1 and 2 Thess.) are from Paul, Silvanus, and Timotheus (Timothy); one (1 Cor.) from Paul and Sosthenes, and one (Galatians) from Paul and "all the brethren that are with me." Their order of publication may have been: 1 and 2 Thessalonians on Paul's second missionary journey; Galatians, Romans, and 1 and 2 Corinthians, on his third; Philemon, Colossians, Ephesians, and Philippians during his imprisonment at Rome. The dates of the first epistle to Timothy and of that to Titus are somewhat doubtful; the second to Timothy was just before the Apostle's martyrdom. For details see the several epistles. Baur only admits the genuineness of four: viz., Romans, 1 Corinthians, 2 Corinthians, and Galatians; but most critics believe the others also to have been the work of the great Apostle.

Pauline-theology, *s.*

Script. & Theol.: The teaching of St. Paul as gathered from his sermons and addresses briefly reported in the Acts of the Apostles, and his Epistles. [PAULINE-EPISTLES.] He gives prominence to the doctrine of justification by faith without the deeds of the law (Acts xiii. 39; Rom. iii. 19–31; iv. 1–25; v. 1; Gal. ii. 16; iii. 8, 24, &c.). But he so states the doctrine as not to encourage sin (Rom vi. 1–23), and of the three Christian graces he assigns the pre-eminence to love, rendered in the A. V. charity (1 Cor. xiii. 13). The Apostle of the Gentiles, he contends against numerous gainsayers that the middle wall of partition between the Jews and the Gentiles is broken down, both now standing on the same footing as brethren in Christ (Rom. iii. 29; Ephes. ii. 11–22; iii. 1–11; Col. i. 21, 22; iii. 11). But he speaks of his countrymen with the tenderest affection (Rom. ix. 1–5). The ceremonies of the older economy he regarded as but temporary, and as standing to Christ and the newer one in the relation of a shadow to substance (Col. ii. 16, 17). These broad views rendered the Apostle an object of suspicion to the Hebrew converts (Acts xxi. 20–21), and excited the most deadly animosity against him on the part of the unbelieving Jews (Acts xxii. 21, 22). Baur and others of the Tübingen school consider that St. Paul, in emancipating himself from the Judaic prejudices in which the other apostles were entangled, became the real founder of Christianity as a universal religion; but Prof. Otto Pfleiderer, of Berlin, in the Hibbert Lectures for 1885, rejects this extreme view, and considers Pauline Christianity as a genuine development of the teaching of Jesus.

Ecclesiology & Church History:

1. The Kiss of Peace. In the early Church the Roman *osculum* was adopted and raised to a spiritual significance (Rom. xvi. 16; 1 Cor. xvi. 20; 2 Cor. xiii. 12; 1 Thess. v. 26). To obviate possible danger from this custom, the Apostolic Constitutions strictly decreed the separation of the sexes at public worship. The pax was given at mass in the Western Churches till the thirteenth century, when Archbishop Walter (of York) in 1250 introduced the metal pax [2], and its use spread to the Continent. The pax is now only given at high masses, and the formal embrace [¶] substituted for the kiss is confined to those in the sanctuary.

PAX.

2. An osculatorium; at first probably a crucifix, then a plate of metal adorned with a figure of Christ crucified, or some other pious picture or emblem, passed among the congregation to be kissed as a substitute for the actual kiss of peace. Its use is almost entirely confined to religious houses and seminaries. Called also Instrumentum, Tabella Pacis, Pacificale, and Freda (from Ger. *Friede* = peace).

Tamil *tōkei, tōgei* = a peacock; Dut. *pauuw;* Ger. *pfau;* Fr. *paou.* The latter element is Eng. *cock* (q.v.).]

A. *As substantive:*

1. *Ornithology:*

(1) *Sing.:* Any individual of the genus Pavo (q.v.), specif., the common peacock (*Pavo cristatus*), a native of India, but widely domesticated. The plumage is extremely gorgeous. Head, neck, and breast rich purple, with gold and green reflections; back green, feathers scale-like, with coppery edges; winge, inner coverts, and shoulders, white, etriated with black; middle coverts deep blue, primaries and tail chestnut, abdomen black; train chiefly green, beautifully ocellated. Crest of about twenty-four feathers, webbed only at tip; green, with blue and gold reflections. Bill and legs horny brown. Length to end of tail about four feet, and the train measuree about as much more. The peahen is chestnut-brown about the head and nape; breast and neck greenish, edged with pale whity-brown; upper plumage light hair-brown, with faiut wavings, increasèd on upper tail coverts; tail deep brown with whitish tips; abdomen white; lower parts and under tail-coverts brown. Length thirty-eight to forty iuches; crest shorter and duller than in the male. (*Jerdon.*) Among the Greeks the peacock was sacred to Hĕra, and among the Romans to Juno. It is probable, however, that the bird was not common in Europe till after the Asian expedition of Alexander in the fourth century B.C. By the epicures of the Italian peninsula its flesh was esteemed a dainty (*Juvenal,* i. 143). "Quintus Hortensius (born 119 B.C.) was the first to serve up peacocks at table, at the supper which he gave on entering on the office of augur." (*Macrob.: Satur.,* iii. 13.) Peacocks were formerly served up as a choice dish at banquets [¶], now they are kept solely for ornament. The proverbial reproach, "as vain as a peacock," is scarcely well-founded, for the bird is no vainer thau other birds in the love-season, and the display of his train is intended to attract the attention of the hen-bird, or to outshine some rival.

"The *peacock* during the courting season raises his tail vertically, and with it, of course, the lengthened train, spreading it out, and strutting about to captivate the hen-birds; and he has the power of clattering the feathers in a most curious manner."—*Jerdon: Birds of India,* ii. (pt. ii.), 507.

1. *Zool. & Jewel:* A small, generally globular, spheroidal or hemispheroidal body of nacreous lustre, and composed of compact and free nacres, found as a morbid growth in many shells. The best are from the pearl-oyster or Oriental pearl-mussel, *Avicula margaritifera* and *A. fucata;* others are from the ordinary river mussel (*Unio margaritifera*); the Common oyster, *Ostrea edulis,* from *Anodon cygnea, Pinna nobilis,* the Common Mussel (*Mytilus edulis*), and from *Spondylus gœderopus, Arca Noæ,* and *Anomia cepa.* The pearls in many of these species are white; in the Spondylus they are green or rose-coloured; in *Arca Noæ* violet, and in *Anomia cepa* purple. Pearls have three layers like the shells, but the innermost layer of the shell becomes the outermost in the pearl. Dark lines add to the lustrous effect. The nucleus was formerly conjectured to be sand, but it is now found to be, as a rule, a fragment of brownish-yellow organic substance consisting of the bodies or eggs of internal parasites. Spherical pearls are not formed in the shell, but loose in the soft parts of the mollusc. Foreign substances introduced under the epidermis of the shell are coated with the lustrous substance. The Chinese take this means of obtaining lustrous bodies of various forms. A pearl belonging to Mr. Hope, said to be the largest known, is two inches long, four round, and weighs 1,800 grains. A pearl five-eighths of an inch in diameter was sold in Loudon in 1860 for £2,000; those of two grains weight are worth $2.00, those of five grains $10.00, those of ten $35.00 or $40.00.

¶ The fisheries of the Persian Gulf and of Ceylon have been celebrated since the time of Pliny. [Pearl-oyster.] The most productive Ceylonese banks are those off Condachy; they extend fifty miles from north to south, and twenty from east to west. From some unascertained cause the oysters disappear from their beds at times for years together. The Dutch fishery failed entirely in the years 1732–46 and 1768–96. The English fisheries in Ceylon vary greatly in product. They are under government control, and fishing is only permitted at fixed periods. In fishing the diver descends with the aid of a heavy stone, and on reaching the bottom is obliged to work with the greatest activity, as few can remain down longer than 60 or 80 seconds. The depth varies from 9 to 13 fathoms. Recently private enterprise has been directed to the South Pacific as a pearling ground, and a fleet of thirteen decked boats and two 150-ton schooners are now employed in those waters by one pearl merchant.

By some old travellers this gland was mistaken for a second navel, a circumstance which influenced Cuvier in selecting the generic name.

Church Hist. & Ecclesiastical:

A. *As adj.:* Of or belonging to Pelagius [B.].

B. *As subst.* (*Pl.*)*:* The followers of Pelagius, a monk, probably of Welsh origin, first in high repute for genius, learning, and piety, who, going to Rome about A.D. 400, proceeded, some five years later, to promulgate new views regarding original siu (q.v.) and free grace (q.v.). He was the great opponent of St. Augustine, but there are two reasons why the teaching of Pelagius cannot be exactly ascertained: (1) It is gathered chiefly from the writings of his adversaries; (2) he was willing to adopt orthodox language, provided he might interpret it in his own fashion. Blunt (*Dict. Sects,* pp. 418–20) enumerates the following as his chief errors:

1. The denial of original sin, and, as a necessary consequence, its remission in baptism.
2. The denial of the necessity of grace.
3. The assertion of complete free will.
4. The possibility of a perfectly sinless man.
5. The existence of a middle state for infants dying unbaptized.
6. That Adam's fall injured himself only, and not his posterity.
7. That neither death nor sin passed upon all men by the fall of Adam.

His views were shared by an associate of his, another monk, Celestius, apparently an Irish-

man. Celestius was condemned for heresy in 412 by the Council of Carthage, and in 415 by a synod at Rome, and was banished by the emperor. He was again condemned by a synod at Rome in 430, and by the Council of Ephesus in 431. It is uncertain when he died. The controversy went on in a languishing manner till the seventh century. [SEMI-PELAGIAN.]

"Whilst the *Pelagians* never existed as a sect separate from the Church Catholic, yet wherever rationalism has infected any part of the Church, there Pelagianism has sooner or later appeared; and the term Pelagian has been continued to denote views which minimize the effects of the Fall, and unduly magnify man's natural ability."—*Encyc. 1. *Ornith.:* Any bird of the genus Pelecanus (q.v.), and especially the Common Pelican, the Onocrotalos of the Greeks and Romans, and the *Pelecanus onocrotalus* of modern science. Pelicans are large piscivorous waterfowl, with an enormous pouch, dependent from the flexible branches of the lower mandible, but capable of being contracted when not in use as a depository for food. The species are widely distributed, and frequent the shores of the sea, rivers, and lakes, feeding chiefly on fish, which they hunt in shallow water, the American Pelican (*P. fuscus*) being the only species which dives for its prey. The Common Pelican is about the size of a swan, though its enormous bill and loose plumage make it look considerably larger; it is white, slightly tinged with flesh-colour, and the breast feathers become yellow in old birds. It usually nests on the ground, in some retired spot near the water, and lays two or three white eggs. The pelican sits during the night with its bill resting on its breast; and, as the hook at the extremity of the bill is red, this may have given rise to the legend that the bird feeds its young with blood from its own breast [6], though it is possible that the story has some foundation in fact. It is well known that the males of many species assiduously feed the hen-birds during incubation; and in 1869 the flamingoes in the Zoological Gardens were observed to eject into the mouth of the Cariamas, apparently in the belief that the latter were in want of food, a glutinous red fluid, which, on microscopical examination, was found to consist almost entirely of blood-corpuscles. Mr. Bartlett, who reports the circumstance, says: "Have we here an explanation of the old story of the pelican feeding its young with its own blood? I think we have; for the flamingo was, and is still, found plentifully in the country alluded to; and it may be that in the translation the habit of the one bird has been transferred to the other." (*Proc. Zool. Soc.*, 1869, p. 146.)

"Two specimens of the humerus of as many *pelicans* have been found in the English fens (*Ibis*, 1868, p. 365; *Proc. Zool. Soc.*, 1871, p. 702), thus proving the former existence of the bird in England at no very distant period, and one of them being that of a young example, points to its having been bred in this country. It is possible from their large size that they belonged to *P. crispus*."—*Encyc. Brit.* (ed. 9th), xviii. 474.

2. *Script.:* קָאַת (*qaath*), from a verb in the cognate languages = to vomit, seems to be the pelican (Lev. xi. 18, Deut. xiv. 17, Psalm cii. 6). In the A.V. it is mistranslated cormorant, in Isa. xxxiv. 11 and Zeph. ii. 14, the R.V. restoring uniformity by rendering it pelican.

PELICAN IN HER PIETY.
(*From an encaustic tile designed by Welby Pugin.*)

6. *Art:* The pelican is the symbol of charity. It is generally represented wounding its breast to feed its young with its own blood—a tale told in the fabulous natural history of the middle ages, and which made the bird the adopted symbol of the Redeemer. ¶ (1) When the Reformation struggle terminated by the supremacy of Protestantism, the Roman Catholics both in England and Ireland were put under serious disabilities. Till 1800 the latter country had a parliament of its own, from which, except during the short revolution effected by James II., Roman Catholics were excluded, as they were also from all important offices in the State. The Irish Protestaut Parliament was systematically unjust to the Roman Catholics, though they constituted a large majority of the nation. At the Reformation the endowments had been transferred to the Protestant minority, and when, in 1800, the Irish Parliament ceased, the Protestant church was merged with that of Englaud, under the title of the United Church of England and Ireland. The English Roman Catholics had been excluded from corporate offices in 1667, from the throne in 1689, and from parliament in 1691. The first great step towards the relief of their disabilities was the Catholic Emancipation Act, passed April 19, 1829, which re-introduced them to parliament and to important offices. On January 1, 1871, the portion of the United Church of England and Ireland in the latter island was disestablished and disendowed. There were penal laws against religious sects in the American colonies, but there have been none such in the United States. Public opinion is now increasingly in favor of sweeping every penal law directed against any religion wholly away.

The Council of Trent (sess. xiv., c. iii.) defines that the form of the sacrament consists in the words, "Ego te absolvo," &c., the "quasi materia" in the acts of the penitent—contrition, confession, and satisfaction. The minister of the sacrament is a priest with ordinary or delegated power to absolve, and the subjects those who have received baptism. It is not of obligation to confess venial sins, but mortal sins committed after baptism must be confessed. Roman theologians rely on the words of Jesus (John xx. 23) as proving the divine institution of the sacrament of penance. The dispositions and acts uecessary on the part of the penitent are a hearty sorrow for sin, because it is an offence against God, joined with a firm purpose of amendment, the confession of sins to a priest approved by the bishop, and the performance of the penauce imposed by him.

Penarth-beds, *s. pl.*

Geol.: A series of beds occurring at Penarth Head and Laverock Point, near Cardiff. They are intermediate between the Triassic and the Liassic beds. The base usually consists of a set of gray, green, cream-coloured, and pale-green marls called Tea-green Marls insensibly passing up into dark shales full of fossils, the whole about fifty feet thick. In 1843 Colonel Pollock found similar beds in the North of Ireland full of *Avicula contorta* and *Pecten valoniensis.* He called them the *Avicula contorta* zoue, and considered them to be Liassic, but the fossils are more closely akin to the Trias, and the beds are ranked by Lyell and Etheridge as Upper Trias. The series was traced largely in the Rhætian Alps, and was called by Gümbel, Rhætic. It has relations with the Kössener Schichten of the Tyrol and the Upper St. Cassian beds of Germany. The term Penarth beds was given by the Government surveyors: Etheridge would prefer Rhætic. The genera Ichthyosaurus and Plesiosaurus commence in these beds, which contain also Microlestes (q.v.).

Compar. Religions: The Roman gods of the store-room and kitchen. The family hearth, which formerly stood in the atrium, was their altar, and on it their images, two in number, were placed, with the image of the Lar between them. These Penates were represented dancing and elevating a drinking-horn in token of joy and plenty. The Calends, Nones, and Ides of each month were set apart for their worship, as were the Caristia (Feb. 22) and the Saturnalia (q.v.). Each family had its own Penates, and the State had its public Penates. The worship of these gods was closely connected with that of Vesta (*Cicero: de Nat. Deor.,* ii. 27), in whose temple the public Penates were at one time worshipped, though they had a temple of their own near the Forum. It is possible that the former may have been the Penates of Latium, while the latter may have been the Penates of the city. The origin of these gods is extremely doubtful. According to ancient tradition they were first worshipped in Samothrace, thence brought to Troy, and Virgil (*Æn.* i. 68) makes Æneas the means of their introduction into Italy. As was the case with the Lares, their name was a synonym for home (*Horace: Carm.* iii. 27, 49; cf. *Carm. Sec.,* 39).

"Thus the *Penates,* as simple gods of food, are probably much more ancient than deities like Jupiter, Neptune, Apollo, and Minerva, whose wide and varied attributes represent a power of abstraction and generalization in the minds of their worshippers such as is not possessed by very primitive men."—*Encyc. Brit.* (ed. 9th), xviii. 489.

II. *Technically:*

1. *Mech.:* A simple pendulum is a heavy particle suspended by a fine thread from a fixed point, about which it oscillates without friction. The time of its vibration is directly as the square root of the length, and inversely as the square root of the accelerating force of gravity. The length of the arc through which it vibrates does not affect the result. No simple pendulum can exist; all constructed by man are compound pendulums in which there gravitates, not a particle, but a heavy body called the bob, the law of friction of course operating.

2. *Horology:*

(1) The ordinary pendulum is believed to have been the invention of Ebn Junis of the university of Cordova about A.D. 1100, his companion, Gerbert (poisoned in 1102), making the first escapement. Henry de Wyck (1364), Harris (1641), and Huyghens (about 1657) applied it to clocks, Galileo, in 1581, having recommended a pendulous weight as a true measurer, and Sanitorius, in 1612, the combination of a pendulum with wheel-work. Pendulums generally move in arcs of circles. In the cycloidal pendulum the rod of suspension describes the arc of a cycloid, and in the conical a cone. Heat lengthens, and cold contracts the rod of a pendulum, if it be of a single metal. To neutralize these effects compensation pendulums are made; the gridiron pendulum having bars of iron and steel to work against each other, and the mercurial pendulum making the centre of the oscillation of the bob uniform by the expansion and contraction of mercury inside. The curved line along which the bob of a pendulum moves is called the arc of vibration, the horizontal chord of that are the axis of oscillation, and the point around which the pendulum moves the point of suspension, or the centre of motion. The length of a pendulum vibrating seconds is directly proportionate to the force of gravity at the place. One constructed to beat seconds at London (lat. of Greenwich Observatory, 51° 28′ N.) at the sea-level must measure 39·13983 inches; at the Equator, 39·02074 inches; and at Spitzbergen, 39·21469 inches. To regulate a clock by means of a pendulum, the rod of the latter is made to pass between the prongs of a fork, and thus communicate its motion to a rod oscillating on a horizontal axis. To this axis is fixed a piece called an escapement, or crutch, terminated by two projections named pallets, which work alternately with the teeth of the escapement wheel. As the pendulum moves, the one crutch is raised, allowing the wheel to escape from the control of the pallet, the weight then descends, till arrested and made to re-ascend by the action of the other pallet. The motion of the escapement is communicated by additional mechanism to the hands of the clock, which are thus regulated by the pendulum.

Three hypotheses have been advanced: (1) Wel. *pen gwyn* = white head (*Drayton: Poly-Olbion,* s. 9); (2) Lat. *pinguis* = fat, a name said to have been given by some "Dutchmen," who turn out to be Sir Francis Drake and his men; and (3) a corrupt. of *pin-wing.* In support of the last hypothesis, Mr. Reeks wrote (*Zoologist,* ser. 2, p. 1854) that the people in Newfoundland who used to meet with this bird always pronounced its name "pin-wing." The French *pingouin* = the Great Auk.]

1. *Ornithology:*

(1) *Sing.:* A name first given to the Great Auk (*Alca impennis*), but now applied to any member of the family Sphæniscidæ (q.v.). Penguins are aquatic birds confined to the high southern latitudes of both hemispheres, where they congregate in large flocks. The body is generally elliptical; neck of moderate length; head small; bill moderately long, straight, compressed; tail short. They have no quills in their wings, which are as rigid as the flippers of a cetacean, and utterly useless for flight, though they move freely at the shoulder-joint, forming most efficient paddles, and are usually worked alternately with a rotatory motion. In standing, the penguin preserves an upright position, generally resting ou the tarsus, which is widened like the foot of a quadruped; but in progression this is kept nearly vertical, and the weight supported on the toes alone. They make no nest, and lay a single egg, which is tended by both birds, and the female takes charge of the young for nearly twelve months. The Emperor Penguin is *Aptenodytes patagonica,* and the King Penguin *A. longirostris.* Their moulting is very peculiar; and with respect to a Humboldt's Penguin (*A. humboldti*), formerly in the Zoological Gardens, London, Eng., Mr. Bartlett (*Proc. Zool. Soc.,* 1879, p. 6) says: "The manner in which the flipper-like wings cast off the short scale-like feathers was remarkable; they flaked off like the shedding of the skin of a serpent."

It is very common in Jamaica, where it is plauted as a fence around pasture lands, on account of its prickly leaves. When stripped of their pulp, soaked in water, and beaten with a wooden mallet, they yield a fibre whence thread is made. The juice of the fruit in water makes a good cooling drink in fevers. It is anthelmintic and diuretic, and can also be made into good vinegar.

Script. Canon: A term applied exclusively to the first five books of the Old Testament collectively, termed in Hebrew תּוֹרָה (*torah*) = the Law. The first mention of the fivefold divisiou is by Josephus. It seems to have been made by the Septuagint translators, who then bestowed on the volume a Greek name expressive of what they had done. [Etym.] In its undivided state it is called in Ezra vii. 6, "the Law of Moses;" in Neh. viii. 1, "the Book of the Law of Moses," and, more simply, in 2 Chron. xxv. 4, xxxv. 12, Ezra vi. 18, Neh. xiii. 1, "the Book of Moses." It is the "Book of the Law of the Lord" (Jehovah) in 2 Chron. xvii. 9. Either the Pentateuch or the book of Deuterouomy is the "Book of the Covenant" in 2 Kings xxiii. 2, 21, and "the Book of the Law" in xxii. 8. The titles in both the A.V. and the R.V. of the Bible, following the Septuagint, attribute the five books to Moses. The Hebrew text prefixes his name only to Deuteronomy (Deut. i. 1), and to portions of the others (Exod. xvii. 14, xxiv. 3, 4, xxxiv. 27). No critic attributes Deut. xxxiv. 5 to Moses. Some other passages seem of later date, Gen. xii. 6, xiv. 14 (cf. with Judges xviii. 29), Gen. xxxvi. 31, Lev. xviii. 28, Deut. iii. 11, &c.; others, such as modesty would have prevented Moses from writing (Exod. xi. 3, Num. xii. 3). These are often attributed to Ezra. Except the author of the Clementine Homilies, who disbelieved, and Jerome, who doubted it, the Mosaic authorship of the Pentateuch seems to have been universally accepted by the early Christians. In 1167 Aben Ezra expressed his doubts, as did Hobbes in 1651. Astruc, in 1753, published the hypothesis of different documents proved by the diversity in the Divine names employed [Elohist, Jehovist], a view now accepted by most critics. Since then there have been the Fragmentary Hypothesis of Vater & Hartmann (1815–1818), by which the book is supposed to be made up of fragments put together, and the supplementary Hypothesis of De Wette, and many more. Hengstenberg is the chief opponent of Astruc's hypothesis, considering that the name God is used when creation is referred to, and Jehovah when there is redemption. Between 1862 and 1871 Bishop Colenso, of Natal, published a critical commentary on the Pentateuch, denying the Mosaic authorship of the book, and attributing the Levitical regulations to the priesthood during and after the Babylonian captivity (B.C. 600–450). These views created great excitement. They were controverted in many pamphlets, and led to the ecclesiastical prosecution of their author. [Genesis, Exodus.]

¶ *Samaritan Pentateuch:*

Script.: The Pentateuch in use among the Samaritans. Words which have in them *d* and *r*, and again, *i* and *v*, letters unlike in the Samaritan, but very similar in Hebrew [ד (*d*) and ר (*r*), also י (*i*) and ו (*v*)], are sometimes interchanged, showing that the work was derived from a Hebrew original. The passages attributed to Ezra are in it. It substitutes Mount Gerizim for Mount Ebal in Deut. xxvii. 4. The text in various places differs from the Hebrew, generally, however, agreeing with the Septuagint. The chronology also is in places at variance with that of the Hebrew Bible. If Josephus is correct as to the date of the building of the Temple on Mount Gerizim, the Samaritan Pentateuch was made probably about 330 B.C., though the popular belief is that it is much older.

1. *Judaism:* One of the three greatest Jewish festivals. Its Greek name was given because it was held on the fiftieth day [Etym.], counting from the second of the Passover (Lev. xxiii. 15, 16), whence it was called in Hebrew the Feast of Weeks (Deut. xvi. 9, 10). By this account the enumeration of the weeks was to be from "such time as thou beginnest to put the sickle to the corn." It was called also the Feast of Harvest, or Firstfruits of Wheat Harvest (Exod. xxiii. 16; xxxiv. 22). When it came every Jewish male had to present himself before Jehovah (Exod. xxiii. 17; xxxiv. 23). Meat or wave offerings, especially two wave loaves, and sacrifices were presented at the festival (Lev. xxiii. 16, 17, &c.; Num. xxviii. 26–31; Deut. xvi. 9–12). The Holy Spirit descended on the members of the infant Christian church on the day of Pentecost, imparting the gift of tongues (Acts ii. 1–20). In ancient times the Pentecost lasted but a single day, but modern Judaism extends it to two.

Optics: A faint shadow thrown by a luminous body. It is brighter than the true shadow, though less so than the luminous body itself. It is a modification of the true shadow produced by the commingling with it of rays emitted by a portion of the luminous body. In an eclipse of the moon, the rays which have just grazed the edge of the earth are bent inwards by the refraction of the atmosphere, besides having become tinged with a ruddy or copper hue. Falling upon the moon, then in shadow, they often render it faintly visible, and though of a copper hue, yet bright enough to permit markings on its surface to be seen. Yet at this time the moon is so much behind the earth that it cannot be reached by any direct rays from the sun. In an eclipse the periods when the first and the last contact with the penumbra will take place are always carefully noted.

Zool.: Bandicoots, Bandicoot-rats; a family of Marsupials from Australia, Tasmania, and the Papuan Islands. They form a very distinct family, intermediate between the carnivorous Dasyuridæ and the vegetable-feeding Macropodidæ. II. *Metaph.:* The reception of knowledge through the senses, and the faculty by which knowledge is so received and communication maintained between the subject and the external world. Perception differs from conception, in dealing with things that have an actual, not merely a possible existence; and from consciousness, in that it is concerned with objects external to the mind of the percipient. It is, in brief, the taking cognizance of impressions received by the senses.

"The word *Perception* is, in the language of philosophers previous to Reid, used in a very extensive signification. By Descartes, Malebranche, Locke, Leibnitz, and others, it is employed in a sense almost as unexclusive as consciousness in its widest signification. By Reid this word was limited to our faculty acquisitive of knowledge, and to that branch of this faculty whereby, through the senses, we obtain a knowledge of the external world. But his limitation did not stop here. In the act of external perception, he distinguished two elements, to which he gave the name of *Perception* and Sensation. He ought, perhaps, to have called these *Perception* proper and Sensation proper, when employed in his special meaning; for, in the language of other philosophers, Sensation was a term which included his *Perception*, and Perception a term which included his Sensation."—*Hamilton: Metaphysics* (ed. Mansel), ii. 93.

II. *Philos.* (*Pl.*): The name given to the followers of the Aristotelian philosophy. Aristotle partly adopted the results of Plato, and made them available for the world, partly he dissented from the Platonic doctrines and carried on war against them. Both teachers admitted that science could only be formed from Universals, but Aristotle took the view afterwards called Nominalist (q.v.), and contended that such Universals were nothing more than inductions from particular facts. He thus made experience the basis of all Science. In the middle ages, Albertus Magnus (1193-1280) did much to spread the Peripatetic philosophy, as well as the ethical and physical writings of Aristotle, and his pupil, St. Thomas Aquinas (1227-1274), the greatest of the Scholastics, was much influenced by them. The study of the works of Aristotle has been greatly revived in the present century, and those of St. Thomas Aquinas have been specially recommended to clerical students by the present Pope, Leo XIII.

A. *As adjective:*

1. Of or belonging to Perm, a province of Russia, separated into two parts by the Ural Mountains.

2. Of or belonging to the rocks described under B.

B. *As substantive:*

Geol.: The name given by Sir Roderick I. Murchison, in Oct. 1841, to a series of strata previously looked upon as the base of the New Red Sandstone, but which have greater affinity to the Carboniferous deposits. The two strata are now classified apart, and it is recognised that between them runs the great break separating the Palæozoic from the Secondary strata. Mr. Hull thus divides the English Permian strata:—

		N.W. of Eng.	N.E. of Eng.
		Feet thick.	
Lower Permian.	Red and Variegated Sandstone	3000	100—250
Middle Permian.	Magnesian Limestone and Marl Slate	10—30	600
Upper Permian.	Red Sandstone and Clays.	600	50—100

The Lower Permian consists of the Penrith sandstone. The Labyrinthodont footprints in Corncockle Muir quarry, near Dumfries, were of this age. There are also angular breccias, attributed by Sir Andrew Ramsay to the action of floating ice. The Middle Permian is best seen upon the coast of Durham and Yorkshire, between the Wear and the Tees. [Magnesian-limestone.] The Upper Permian attains its chief thickness at St. Bees' Head, in Cumberland. In Germany two types of strata, a Rothliegende and a Zechstein group, exist in the Permian, hence called Dyas (q.v.). In Russia the Permian rocks occupy an area twice the size of France. The Permian rocks contain a fauna and flora of 110 genera and 229 species, viz. plants, 18 genera and 26 species. Among animal remains are Echinodermata, 2 genera and 2 species; Crustacea, 4 genera and 29 species; Brachiopoda, 15 genera and 36 species; Conchifera, 20 genera and 37 species; Gasteropoda, 11 genera and 26 species; Cephalopoda, 1 genera and 1 species; Fishes, 11 genera and 26 species; Reptiles, 9 genera and 17 species. No birds or mammals. (*Etheridge.*) Among the plants are Psaronius, among the fishes, Palæoniscus, and among the reptiles, Proterosaurus (q.v.); the former are but few compared with those of the immediately preceding Carboniferous system. Mr. Etheridge believes that the Permian rocks in general were deposited in isolated basins, probably of fresh water, which underwent extreme concentration and chemical precipitation. Some salt springs rise in or through the formations. There are traces of extinct Permian volcanoes in Dumfries and Ayrshire. The Permian system is almost absent from the United States, and from North America generally, there being but a few isolated traces of it in the Western States. There it is not easy to separate the Permian from the Carboniferous, the latter running upwards into the former, with no clear line of demarkation.

perpendicular-lift, *s.*

perpendicular-style, *s.*

Arch.: The third period of Pointed Architecture. It originated at the end of the fourteenth century, and continued until the close of the sixteenth, when it was succeeded by the Revived, or Debased Classic, known as the Elizabethan. It is also known as the Florid, from the multiplicity, profusion, and minuteness of ornamental detail, and its more general name, Perpendicular, is derived from the mullions of the windows and the divisions of ornamental panel-work running in straight or perpendicular lines, which was not the case in any earlier style. The pointed arches are constructed from almost every radius. The most common doorway is the depressed four-centred arch (almost peculiar to this style) within a square head, having generally a hood-moulding over, the spandrels being filled with quatrefoils, panelling, roses, foliage, small shields, or other sculptured ornaments. Fan-shaped roofs, ornamented with dependent pendants resembling stalactites, are also peculiar to the Perpendicular style. Richly decorated roof-trusses, which are left clearly visible, are also of frequent occurrence. In these roofs the spaces between the highly ornamented and moulded beams

ROOF-TRUSSES, WESTMINSTER HALL.

are filled with rich tracery, whilst the intersections and junctions of the woodwork are enriched with dependent carving and representations of foliage and figures. Westminster Hall is an instance of this description of roof. The roofs, when they are plain, are sometimes overlaid with boarding, and divided by ribs and panels.

I. A motion, which, once generated by mechanical means, should have the power of perpetuatiug itself.

"As the result of the vain search after the *perpetual motion* there grew up the greatest of all the generalizations of physical science, the principle of the conservation of energy."—*Encyc. Brit.* (ed. 9th), xviii. 533.

2. A machine, which, according to the hopes of its inventors, after it has beeu once set in motion, will go on doing useful work, without drawing on any external source of energy. Such a machine would entirely coutrovert the established principle of the conservation of energy, and since the establishment of that principle the search for a perpetual motion has been judged visionary. So early as 1775 the Académie des Sciences of Paris placed the problem in the same category with the duplication of the cube and the quadrature of the circle, and refused to receive schemes claiming to have overcome the difficulty—in reality, to have performed the impossible. The overbalancing wheel was a favonrite contrivance with the seekers after a perpetual motion. It appears as early as the thirteeuth century, and was adopted by the Marquis of Worcester (*Cent. Inventions*, art. 56) and by Orffyreus. Perpetual motions have been founded on the hydrostatic paradox, on capillary attraction, on electricity and magnetism, but in every case the result has been the same. (The subject has been fully treated by Mr. Heury Dircks, in his *Perpetuum Mobile.*)

"Briefly, a *perpetual motion* usually means a machine which will create energy."—*Encyc. Brit.* (ed. 9th), xviii. 553.

¶ The word first became current in Christian circles in connexion with "ten" persecutions of Christians under the Roman emperors. The first was the persecution under Nero, A.D. 64; the second, that under Domitian, A.D. 95; the third, that under Trajan, A.D. 106; the fourth, that under Marcus Aurelius, A.D. 166; the fifth, that under Septimius Severus, A.D. 198; the sixth, that under Maximin I., A.D. 235; the seventh, that under Decius, A.D. 250; the eighth, that under Valerian, A.D. 258; the ninth, that under Aurelian, A.D. 275; and the tenth, that under Diocletian, A.D. 303. The arrangement is not perfect. If only persecutions general through the empire are counted, the number is fewer than ten; if local ones are taken into account, they are more numerous. When Christianity became dominant in portions of the Roman empire, it used the civil power for the overthrow of heathenism. The mediæval church persecuted all whom it considered heretics, and the Reformation in England everywhere had to struggle against persecution. When it became powerful enough, it also became intolerant to those who differed from it, passing and carrying out penal laws against Roman Catholics, dissenters, and unbelievers. Whilst Great Britain and America have made great strides towards religious liberty, they are not at all times free from the spirit which prompts to persecution.

II. *Art:*

1. The science of representing appearances, and as such is opposed to geometry, which is the science of representing facts. It is founded upon such rules as can be deduced from the facts which are discovered by looking at objects through a sheet of glass or other transparent medium placed upright between the object and the observer. This is indicated in the etymology of the word. It is found when objects are so looked at that their apparent form is very different from their real one, both as regards shape and distinctness. The portion of the subject which deals with the changes in form is absolutely scientific; it is called Linear Perspective. The changes in distinctness are effected by distance and atmosphere, and differ constantly with different conditions of light and atmosphere. It is the purely artistic side of the science which is called Aërial Perspective, and success in its application depends upon the individual ability of the artist. The chief point with which Linear Perspective has to deal is the apparent diminution in size of objects as they recede from the spectator, a fact which any one can test by observing a long straight stretch of railway. The cross sleepers and the telegraph poles diminish in apparent size to the point of invisibility when they are far off on the horizon. It is the rules which govern such changes as these which are dealt with by Linear Perspective; while the fact that the same telegraph poles, black and brown and yellow when seen close, gradually put on a blue hazy colour as they become more distant is one of the facts dealt with by Aërial Perspective. A practical knowledge of the science is absolutely a necessity for a successful artist.

II. *Physiology:*

1. *Human:* Watery matter "breathed out," or made to expire from the system by means of the pores in the skin. It is more copious than the matter sent forth from the lungs by respiration, averaging eleveu grains per minute against seven from the lungs. The quantity varies greatly, and is affected by the amount of heat or dryness in the atmosphere, by the fluid drunk, by the exercise taken, by the relative activity of the kidueys, by medicine, &c. The relative proportions of sensible and iusensible perspiration also vary; and sometiues, whcu, seeing drops on our skin, we believe that we are perspiring copiously, the increase is chiefly in the sensible kiud, not in the total amount. Less than two per cent. of solid matter is contained in the watery vapour. The chief ingredients are: sodium chloride, formic, acetic, butyric, and perhaps propionic, caproic, and caprylic acids; neutral fats, cholesterine, nitrogen, &c. In acute Bright's disease urea is also present, and imparts a urinous odour to the vapour passing off from the system. Besides keeping the skin iu a healthy, moist condition, and acting as a refrigerator, perspiration takes its share in carrying off superfiuous or noxious matter from the system. If stopped, morbid consequences are sure, sooner or later, to ensue.

The belief that "the times are very evil" has found expression in almost every philosophic and religious system at one period or other of its existence. But it was at the beginning of this century that Pessimism began to create a literature of its own, and to impart a sombre hue to the writings of men not avowedly its disciples. As examples may be cited Byron's *Euthanasia* and Heine's *Fragen.* The adherents of this philosophy have for the most part belonged to the German races, Leopardi (1798–1837) being the sole Latin writer of note who has advocated pessimist theories. (For an account of Schopenhauer and his writings, see his *Life*, by Miss Zimmern.)

"In their special and technical employment, optimism and *pessimism* denote specific theories elaborated by philosophers . . . the latter [to show] that existence, when summed up, has an enormous surplus of pain over pleasure, and that man in particular, recognizing this fact, can find real good only in abnegation and self-sacrifice."—*Encyc. Hist. & Education: The system of education introduced by Pestalozzi. It brought no new principle to bear upon the subject, but put in practice one already established, that education is rather a developing of the faculties than an imparting of knowledge. In his book, *How Gertrude teaches her Children*, Pestalozzi lays down the following dicta:—

1. Demonstration is the foundation of teaching.
2. Instruction should begin with the simplest elements, advancing step by step to the more difficult.
3. The first lesson should be mastered before attempting a second.
4. The true end of education to be kept in view.
5. The relation between teacher and scholar should be that of love.

To Pestalozzi is due the introduction of object-lessons; and Fröbel, the founder of the Kindergarten system, who was one of Pestalozzi's pupils, probably obtained the first germs of his own method from his early preceptor.

II. *New Test. Biog.:* The Greek surname of an apostle of Jesus. It is the renderiug of the East Aramæan ܟܹܐܦܵܐ (*kepha*), a corruption or derivation from Heb. כֵּף (*keph*) = a rock (Job xxx. 6; Jer. iv. 29), and was given by Jesus (John i. 40-42). Transliterated into Greek, with a termination, it became Κηφᾶς (*Kēphas*) (Gal. ii. 9). Peter's real name was Simon (Matt. xvii. 25; Luke iv. 38, v. 3, 5, &c), his father's Jonas (John xxi. 15), his brother's Andrew (Matt. iv. 18). Peter was born at Bethsaida (John i. 44), but had removed to Capernaum, where he had a house, being a married man (Matt. viii. 14; Mark i. 30; Luke iv. 38; 1 Cor. ix. 5). For his call to be an apostle, see Matt. iv. 18; Mark i. 16-18; Luke v. 1-11; John i. 35-42. Three of the twelve were selected on three occasions by Jesus for special honour (Mark v. 37; Matt. xvii. 1, xxvi. 37), Peter's name standing first, though John was the disciple whom Jesus loved (John xix. 26, xx. 2, xxi. 20, 24. [Pillar-apostles.] The Power of the Keys was first bestowed on him (Matt. xvi. 13-20), though afterwards also on the other apostles (cf. xviii. 1 with 18). Peter was of an impulsive temperament, generous, but too forward in speech (xvi. 22, 23), and rash in action (John xviii. 10). It was not natural cowardice, but because through his rashness he had committed himself, and was in danger of arrest, that made him deny his Lord (Matt. xxvi. 51-75). After the Ascension, he was for a time the most prominent of the apostles (Acts i. 15, ii. 14, &c., iii. 1-26, iv. 8, 9, v. 1-16), and though specially sent to the Jews (Gal. ii. 8), yet had the privilege of being the first to admit Gentiles into the church (Acts x. 1-48). Afterwards he was somewhat cast into the shade by the eminence of St. Paul, and on one occasion dissembling his liberal views when in narrow Judaic company, was withstood by St. Paul to the face "because he was to be blamed" (Gal. ii. 11). Tradition makes him die as a martyr at Rome, about A.D. 64, crucified with his head downwards. Roman Catholics claim him as the first Bishop of Rome, and consider that the authority delegated him by Jesus appertains also to his successors, the Popes of Rome.

¶ (1) *The First Epistle General of Peter:*

New Test. Canon: An epistle which claims to have been written by the Apostle Peter (i. 1), apparently from Babylon (v. 13), "to the strangers scattered throughout Pontus, Galatia, Cappadocia, Asia, and Bithynia" (i. 1), all places in Asia Minor. These strangers were obviously Christian converts, the majority apparently Gentiles (i. 14, ii. 10, iv. 3). Their churches were in charge of elders (v. 4). They were in suffering (i. 6), which the apostle foresaw would deepen into severe persecution (iv. 12-18). He exhorts them to steadfastness, to careful avoidance of crime and scandal (ii. 12, iv. 15), to humility (v. 5-6), and the proper observance of their duties of subjects, servants, husbands or wives, brethren in a natural or spiritual sense (ii. 13—iii. 8), office-bearers, or members in Christian churches (v. 1-5). The epistle was probably carried by Silvanus (v. 12). St. Mark seems to have been with Peter when it was written (v. 13). Its date is uncertain, probably between A.D. 60 and A.D. 64. There is strong evidence for its authenticity, which has rarely been doubted.

(2) *The Second Epistle of Peter:*

New Test. Canon: Another epistle claiming to have been penned by the Apostle (i. 1), the author also referring to the transfiguration scene as one which he personally witnessed (i. 17, 18), and to a previous epistle (iii. 1). In this second letter he seeks to establish Christians in the faith, warns them against false teachers, and predicts the general conflagration of the world. Its style is different from that of the first. The language and sentiments of ch. ii. and part of iii. resemble Jude. When it was published, the epistles of St. Paul had been collected, and formed part of New Testament Scripture (iii. 15-16). The evidence for its authenticity is much less strong than that for the first epistle. Clement of Alexandria seems to have known it. It is not in the Peschito (q.v.); Cyprian ignored it; Origen and Eusebius placed it among the controverted writings, but it gradually obtained acceptance before the close of the fourth century.

From being sent to Rome it was called by the Saxons Rome-feoh, Rome-scot, and Rome-pennyng. The name Peter-pence arose from its being collected on St. Peter's Day. From being levied on every private and every religious house, the Abbey of St. Albans only excepted, it was called also Hearth-money. At first it was used chiefly for the support of an English college at Rome, then the Pope shared the gift with the college, and finally appropriated the whole. Edward III. forbade its being paid; but it was soon restored. The Act 21 Henry VIII. c. 21, passed in 1534, swept it away.

Church Hist. (Pl.): The followers of Peter de Bruys, who, about A.D. 1110, attempted religious reform. He was burnt by an angry populace, at St. Giles's in 1130. The tenets attributed to him by Peter, Abbot of Cluny, who in 1141 wrote to confute him, were that persons should not be baptised till they reached years of discretion; that there should be no churches built, and that those already erected should be pulled down; that crosses should be abolished; that the sacred elements in the communion are only signs of the body and blood of Christ, and that the oblations, prayers, and good offices of the living do not profit the dead. Peter is regarded with much respect by some Protestants, who claim him as a reformer before the Reformation. His followers continued till the sixteenth century.

pĕ-trō'-lĕ-ŭm, *s.* [Lat. *petra* = a rock, and *oleum* = oil.]

Chem.: Earth oil, naphtha, mineral oil, paraffin oil. A term applied to a variety of inflammable liquids found naturally in many parts of the earth, and formed by the gradual decomposition of vegetable matter beneath the surface. These liquids vary in colour from a faint yellow to a brownish-black, and in consistence from a thin transparent oil to a fluid as thick as treacle, and their specific gravities range from ·7 to 1·1. They are met with in most countries of Europe, but occur in abundance in Pennsylvania and other parts of the United States, in Canada, at Baku, on the Caspian Sea, and elsewhere. Pelouze and Cohours have shown that these oils consist mainly of homologues of marsh-gas, and they were able to isolate by fractional distillation twelve members of the series [PARAFFIN, 1. (2)], gaseous, liquid, and semi-solid. A light petroleum oil is used all over the world for illuminating purposes, and a heavy oil for lubricating machinery. The former should have a sp. gr. ·810 to ·820, and should not evolve inflammable vapour until heated to 55°. If an oil gives off inflammable vapour below this temperature it is considered unsafe for domestic use. Nat. Science: The study of the mineralogical and chemical composition of rocks; including the various changes they have undergone through physical and chemical agencies, either combined or separate. Macroscopic and microscopic examination, together with chemical analysis, are the methods pursued. If the rock is of sufficiently coarse texture, an examination by an ordinary lens suffices, but in rocks of fine grain a thin section is prepared, and, under the microscope, the individual mineral constituents are recognized by their specific structural and optical characters. The chemical analysis is performed either on the rock as a whole, or the mass is pulverised, and the mineral species of which it consists separated by certain fluid chemical compounds of known density, and the products of this separation separately analysed.

Compar. Relig.: The worship of the fertilizing power of nature under the symbol of the phallus (q.v.). The idea that natural productions were engendered in a manner akin to the propagation of man and the lower animals is poetically expressed by Virgil (*Georg.* ii. 325–327) and Lucretius (i. 257, 599). Phallism appears to have been at first an independent cult, but was afterwards adopted into other forms of worship, or it may have been the germ whence other forms sprang. Its origin is unknown. The Phœnicians ascribed its introduction iuto their worship to Adonis; the Egyptiaus to Osiris, the Phrygians to Atys, and the Greeks to Dionysos, but such a belief may well have arisen in many places in the infancy of the human race. [ASHTORETH, BAAL, BEL, GROVE, *s.*, II. I, LINGA, SERPENT-WORSHIP, YONI.]

II. *Judaism (Pl.):* The most numerous of the three divisions or orders of Judaism in the time of Christ, the other two being the Essenes and the Sadducees. They were so called because they kept aloof from Levitically impure food, separated themselves from the lawless people of the land, and united to keep the Mosaic law in accordance with Ezra vi. 21, ix. 1, x. 11; Neh. ix. 2, x. 28. They arose immediately after the return from the Babylonish captivity. As all the students of the law naturally joined this association, the appellation Member, Associate, חָבֵר (*chaber*), or Pharisee, פָּרוּשׁ (*parush*), became synonymous with student, disciple, lawyer, scribe. Accordingly, they represeuted the national faith of orthodox Judaism. Having to expound, to adapt to the vicissitudes of the commonwealth, and to administer such an extensive and gorgeous ritual as that of the Mosaic law, some of the Pharisees fell into extravagances, and laid more stress on trifling and petty formulæ than on the spirit of the law. Hence, the Talmud itself divides the Pharisees into seven kinds: "(1) The *shoulder* Pharisee, who carries, as it were, his good works on his shoulders to boast of them openly, and is weighed down by his innumerable virtues; (2) the *time-gaining* Pharisee, who, when you ask for anything, always says, 'Let me go first to do a godly work;' (3) the *deducting* Pharisee, who says, 'Deduct from my many virtues the few vices I commit;' (4) the *saving* Pharisee, who says, 'I save from my small means to be able to spend it on good works;' (5) the Pharisee who says, 'Would that I knew what sin I committed that I might atone for it by doing a good work;' (6) the *God-fearing* Pharisee, and (7) the *God-loving* Pharisee (*Jerusalem Berachoth*, ix. 14; *Babylon Sota*, 22 *b*), the last two of which alone are to be commended." It is the first five kinds to whom the rebukes of Christ refer, and who have given rise to the term Pharisee being used as synonymous with a strict observer of external forms of religion without the spirit of it. Hist. & Education: The name given to a school founded at Dessau, in 1774, by J. B. Basedow (1723–90), or to any school conducted on similar principles. The object was to give children an education founded on philanthropy, cosmopolitanism, and natural religion. Every boy was taught a handicraft. Of the twenty-four hours eight were allotted to sleep, eight to meals and recreation, and of the remaining eight the children of the rich were to study six and give two to manual labour, the proportions being reversed in the case of the children of the poor. Great results were expected from this attempt to place education on what was called a natural basis. But Basedow was unfitted for the post of director, and the Philanthropin, though protected by the Duke of Dessau, was never numerously attended, and was dissolved in 1793.

¶ *The Epistle of Paul to Philemon:*

New Test. Canon: An epistle of Paul, in conjunction with Timothy (i. 1), to Philemon, whose runaway slave, Onesimus, had come to Rome, and been converted by the Apostle, while the latter was a prisoner (i. 10), and advanced in years (9). Onesimus was most useful to his spiritual father (13), who, however, would not retain him, unless with his master's permission (14). He, therefore, sent him back, carrying the epistle with him, and counselling Philemon to receive him back, not now in a servile capacity, but as a brother beloved (16). Anticipating his speedy release, he also requested Philemon to prepare him a lodging (22). The epistle seems to have been written in A.D. 63 or 64, and to have been sent with the Epistle to the Colossians. Its genuineness is generally admitted.

¶ *The Epistle of Paul the Apostle to the Philippians:*

New Test. Canon: An epistle addressed by St. Paul, in conjunction with Timothy, "to all the saints in Christ Jesus which are at Philippi, with the bishops and deacons." Shortly after Paul had passed for the first time from Asia to Europe, he reached Philippi, then a Roman provincial capital and colony (Acts xvi. 12). It lay about nine miles inland. His first convert, Lydia, was from Thyatira, in Asia Minor (Acts xvi. 14; cf. Rev. i. 4, 11); his next was a certain damsel possessed with a spirit of divination (16–18) in connection with whom rioting occurred, followed by Paul's imprisonment, and the conversion of his jailor (19–40). Thus Paul was the founder of the Philippian church. Timothy was subsequently sent into Macedonia, and doubtless to Philippi (xix. 22), Paul himself following (xx. 1–6). (Compare with the facts regarding Timothy, Philippians i. 1, ii. 19–23). The Philippians had oftener than once sent the apostle pecuniary contributions (iv. 10–18), long being the only church which had done so. Epaphroditus had brought these gifts (ii. 25, iv. 18), and afterwards, falling very dangerously sick (ii. 26, 27), Paul had sent him back that the Philippians might be assured of his recovery, apparently requesting him to carry with him the epistle (ii. 28). The apostle when he sent the epistle was a prisoner in Rome (i. 7, 13; iv. 22). He expected release (i. 25; ii. 24), though martyrdom was by no means impossible. He expresses intense affection for the Philippians (i. 8), and thankfulness for their Christian character (i. 4). He counsels them to avoid strife, vainglory, murmurings, controversies (ii. 3, 14), points to the Son of God as the exemplar of humility and self-sacrifice (ii. 5–11), and warns his readers against Judaising teachers (iii. 2–11), and immoral and self-seeking men (18, 19). The Christians sending salutations to the church at Philippi were chiefly of Cæsar's household (iv. 22). The genuineness of this epistle is generally admitted, though Baur (1845), and Schwegler (1846), held the contrary view. Its date was probably early in A.D. 63.

1. The term is said by Diogenes Laertius (Proem) to have been suggested by Pythagoras [B.C. 570–504 (?)], who, on being complimented on his wisdom, said that he was not wise but a lover of wisdom, the Deity alone being wise. Philosophy, while earnest in amassing knowledge, aimed chiefly at penetrating to the principles of things. Popularly, it is divided into Natural and Mental Philosophy, the former investigating the physical laws of nature, the latter those regulating the human mind. The term philosophy is now generally restricted to the second of these. Even as thus reduced it has a very wide sphere. Thus, there is a philosophy of history. [HISTORY.] The Hindoos have six orthodox schools of philosophy, the Nyaya, the Vaisheshika, the Sankhya, the Yoga, the Purva Mimansa, and the Uttara Mimansa or Vedanta. All the nations of antiquity had a philosophy, that of the Greeks being specially celebrated. The chief schools were: the Pythagorean, commenced about 500 B.C.; the Platonic, B.C. 374; the Peripatetic, B.C. 334; the Sceptic, B.C. 334; the Cynic, 330; the Epicurean, B.C. 306; the Stoic, B.C. 280; the Middle Academy, B.C. 278; the New Academy, B.C. 160; the New Platonists, A.D. 200 (?). Of modern systems the perceptive and sensational philosophy of Locke arose about 1690; the idealistic of Berkeley and Hume, 1710; the common-sense philosophy of Reid, &c., 1750; the transcendental of Kant, &c., 1770; the scientific philosophy of Fichte, 1800; the idealistic philosophy of Hegel in 1810; the positive philosophy of Comte in 1830, and the evolutionary philosophy of Herbert Spencer in 1852, or more decidedly in 1855.

solutions in white needles or laminæ, which turn yellow on becoming anhydrous.

The salts formed by the alkalis and metals are highly crystalline.

It melts at 180°, has a saccharine taste, and its alkaline solutions absorb oxygen from the air, forming an orange-coloured substance.

Chem.: $C_{21}H_{24}O_{10}$. A substance ready formed in the root-bark of the apple, pear, and other trees, and extracted by weak alcohol. The solution, when decolorized and concentrated, deposits crystals of phlorizin on cooling, in the form of long silky needles, having a bitter taste, and dissolving readily in boiling water and alcohol, but insoluble in ether. By the prolonged action of mineral acids it is converted into phloretin and glucose. Anhydrous phlorizin melts at 109°, and decomposes at 200°.

The hydrated crystals belong to the trimetric system, are sweeter than cane sugar, neutral, permanent at common temperatures, and melt at 220°. They dissolve in water, alcohol, and ether, strike a violet-red colour with ferric chloride, and reduce copper salts like dextrose. 1. A character used in phonography; a type or character used for expressing a souud.

2. An instrument for recording and reproducing sounds, invented by Mr. T. A. Edison. It consists of a cylinder of brass, mounted axially upon a steel screw, the pitch of which corresponds with that of a spiral groove on the outside of the cylinder. Attached to the base board by a movable arm is a mouthpiece with a diaphragm, from the centre of the under surface of which projects a steel point. To use the instrnment, the cylinder is wrapped round with tinfoil, and the arm so adjusted that when the axle is revolved, the whole of the groove on the cylinder will pass in succession uuder the poiut. On speaking into the mouthpiece, at the same time turning the cylinder, every vibration of the diaphragm causes the point to make a corresponding mark upon the tinfoil. The arm being temporarily turned back, the cylinder can now be set back to its original position, and on turning it with the mouthpiece in position as at first, the stylus, travelling over the indentations in the type-laden tinfoil, causes the diaphragm to vibrate as before, thus producing the original sounds.

phosphate of soda, *s.*

1. *Chem.:* $PO(NaO)_2HO + 12OH_2$. Orthophosphate. Common tribasic phosphate. Prepared by treating bone ash with sulphuric acid, and then adding carbonate of soda in slight excess to the acid filtrate. On evaporation the phosphate of soda crystallizes in oblique rhombic prisms, which dissolve in four parts of cold water. It is bitter, purgative, and alkaline to test paper. $NaPO_3$ = metaphosphate of soda. Monobasic phosphate. Formed by the action of heat on acid tribasic phosphate, or microcosmic salt. 1. The property which many substances and organic beings possess of emitting light under certain conditions.

2. A phosphoric light.

"A large number of substances . . . emit in darkness a *phosphorescence.*"—*Ganot: Physics*, § 626.

¶ Becquerel traces five causes of phosphorescence: (1) Spontaneous action; (2) Elevation of temperature; (3) Mechanical action, as friction, percussion, or cleavage; (4) Electricity, and (5) Insolation. Examples of No. (1) may be seen among plants in certain fungals, also at times in decaying wood. Among animals, some of Cuvier's sub-kingdom Radiata have the power of emitting light in the dark, especially if they are disturbed, and the phosphorescence of the sea in tropical, and even at times in temperate climates, is attributed to a small infusorial animalcule, *Noctiluca miliaris* [Noctiluca], aided by *Physalia utriculus*, and other Medusæ, Tunicata, Annelids, &c. On land, of insects, some millipedes, the female glow-worm, and the fireflies, emit light. In the glow-worm the light is from the under side of the terminal segments of the abdomen. In the case of various Elateridæ the phosphorescence is from a small, white, oval spot on each side of the thorax. Darwin considers that the phosphorescence of insects has been correctly explained by Mr. Belt to be a signal held out to their foes that they are unpalatable. The phosphorescence of fish in a cupboard is well known; also of decaying animals in marshes. Illustration of No. (2) may be seen in certain diamonds and in fluor spar, which heated to 300°-400° become luminous. Illustrations of No. (3) may be observed in phosphorescence when two crystals of quartz are rubbed together, or when a lump of sugar is broken.

Liquid phosphide, H_2P, is obtained in small quantities when phosphide of calcium is treated with water. The gas evolved is passed through a tube surrounded with a freezing mixture, which condenses this compound as a colourless and highly refractive liquid. In contact with air it inflames instantly. 1. *Ord. Lang.:* The morning-star; Phosphor (q.v.)

2. *Chem.:* Symbol P; at. wt. = 31. A non-metallic pentad element. Found in a state of combination in the unstratified rocks, the soil, the organism of plants, and the bodies of animals. Discovered by Brandt in 1669. It is prepared from powdered calcined bones by treating them with two-thirds of their weight of sulphuric acid diluted with water, evaporating the liquid portion, and, after mixing with charcoal, desiccating by heating in an iron vessel. The dry mass is then introduced into a stone retort, heated, and the phosphorus evolved collected under water. It resembles imperfectly bleached wax, is soft and flexible at common temperatures; sp. gr. 1·77; vapour density, 4·35; melts at 42·2°, and boils at 287°. On cooling, it sometimes forms dodecahedral crystals. It is insoluble in water, and is kept in that liquid, but dissolves in native naphtha and bisulphide of carbon; is very inflammable, and sometimes takes fire from the heat of the hand. A remarkable modification exists under the name of amorphous phosphorus, prepared by exposing common phosphorus to 250° for fifty hours. It is a reddish-brown infusible substance, insoluble in bisulphide of carbon; sp. gr. 2·089 to 2·106. It is not luminous in the dark, and can be reconverted into ordinary phosphorus when heated to 260°. Used on a very large scale in the preparation of safety matches. [Bologna-phosphorus.]

It is solid, orange-coloured, and is rapidly converted into phosphorous acid. Phosphorous anhydride, P_2O_3, is obtained as a white powder by burning phosphorus in a limited supply of dry air. Phosphoric anhydride, P_2O_5, formed when dry atmospheric air is passed over burning phosphorus contained in a suitable apparatus. It is obtained as a snow-like powder, having a great attraction for water. When thrown into the latter, it combines with explosive violence. It is readily volatilized.

phosphorus-paste, *s.* A poisonous compound for the destruction of rats, mice, cockroaches, &c.

phosphorus-pill, *s.*

Pharm.: Phosphorus two grains, balsam of Tolu 120 grains, yellow wax 60 grains. Dose, three to six grains. [Phosphorus.]

phosphorus-poisoning, *s.*

Chem.: Phosphorus, especially when finely divided, is highly poisonous. Fatal effects are sometimes produced by very small doses, the use of ·11 grain having ended fatally. Some hours often elapse before the worst symptoms appear, consisting generally of a burning pain, vomiting, and, after two or three days, jaundice, and large effusion of blood. It is not very amenable to antidotes unless they are applied at an early stage, but an emetic should at once be administered, in the form of 10 grains sulphate of zinc or 30 grains of powdered ipecacuanha, or, if these are not at hand, some mustard in hot water. One dram of French oil of turpentine should then be given floating on water, and repeated in half-dram doses every half-hour for some time.

phō-tō-cŏl'-lō-tўpe, *s.* [Pref. *photo-*, and Eng. *collotype*.] A process of printing from the surface of a film of gelatine, based upon the fact that gelatine, exposed to light, in the presence of an alkaline bichromate, loses its power of absorbing water. A piece of plate-glass is coated thickly with a solution of gelatine and potassium bichromate, dried in the dark, and exposed to light under a reversed positive. It is next turned over and exposed, through the glass, to diffused light for a short time to diminish the swelling caused by the subsequent wetting. After well washing to remove the superfluous bichromate, it is rolled with greasy ink, which only adheres perfectly to the parts which have not absorbed water, and to the others in proportion to their dryness. The subsequent manipulations are as in lithography.

phō-tō-ĕ-lĕc'-trō-tўpe, *s.* [Pref. *photo-*, and Eng. *electrotype* (q.v.).] A block made mainly with the aid of photography and of the electrotyping process, and which can be printed with type like a woodcut. A photographic negative of the subject required is printed on a film of gelatine which has been treated with bichromate of potash, to render it sensitive to the action of light. Those parts on which the light has not acted are soluble in water, and are washed away, leaving the printed parts that are insoluble in relief. From this relief a mould in wax is taken, and an electrotype made in the usual way.

phō-tō-ĕn-grāv'-ĭng, *s.* [Pref. *photo-*, and Eng. *engraving* (q.v.).]

1. A term applied to processes for producing printing blocks or plates by photography. The most commonly employed process is to coat a metal plate with a thin film of asphaltum, and expose it to light under a reversed positive. The picture is next developed by dissolving away the parts of the asphaltum not acted upon by the light, and the plate is subsequently etched in the usual way. This process is sometimes called Photo-aquatint. The second method is more elaborate. A film of bichromated gelatine, on a sheet of glass or a copper plate, is exposed under a photographic negative, and the imprinted portions which are soluble in water washed away, leaving the printed parts in relief. The plate with the relief is next coated with a film of

silver by electro-deposition, and placed in an ordinary electrotyping bath, in which it is allowed to remain until a shell of copper from one-sixteenth to one-eighth of an inch thick (according to size of plate) is formed. This, after the rough excrescences have been removed by filing, becomes the printing plate. It can be worked upon by an engraver, if necessary, to remove photographic defects, and is printed at a copper-plate press. When a relief block is required, a reversed negative is used to print from, and the etching is carried to a much greater extent. Obviously these processes will only answer for subjects in black and white, no satisfactory method of translating the half tones of a photograph into an ordinary printing block or plate, having yet (1885) become public property. [PHOTOGRAVURE, PHOTOELECTROTYPE.]

2. The process of making photoelectrotypes. [PHOTOGRAVURE.]

phō-tŏĝ'-ra-phy, *s.* [Pref. *photo-*, and Gr. γράφω (*graphō*) = to write; Fr. *photographie.*] The art of producing pictures by the action of certain sensitive substances, under the influence of light. It may be said to have sprung from the discovery, some three hundred years ago, that the luna cornea of the alchemists—*i.e.*, fused silver chloride—would darken on exposure to light. Nothing more was known until in 1777 Scheele, the Swedish chemist, noticed that the power which produced this darkening resided chiefly in the violet end of the solar spectrum. In 1802 Thomas Wedgwood published his method of taking profiles, upon paper or white leather treated with nitrate of silver, and exposed to the light of the sun under the object to be represented. For many years no method was known of fixing the picture, *i.e.*, of dissolving away the unaltered sensitive salt; but the difficulty was eventually overcome by Sir John Herschel, when he suggested the use of hyposulphite (thiosulphate) of soda, a salt now used for the same purpose in hundreds of tons. M. Niepce was the first worker with bitumen of Judæa, which loses its solubility in certain media when exposed to the light, and his method has since been enormously developed as the basis of photoetching, and many other processes. The year 1839 was one of paramount importance in the history of photography, for then Henry Fox Talbot published his calotype process, in which paper, having on its surface chloride of silver, was exposed in a camera obscura (q.v.), and the image developed by a solution of gallic acid. The discovery of this kind of development, which marks an epoch in the history of photography, is due to the Rev. J. B. Reade. The pictures so produced were negatives (q.v.), and from them positives were obtained by exposing to light, under them, another sensitive sheet. The substitution, in the next year, of silver iodide for chloride, greatly improved the process, which was now thoroughly workable, and by its means many beautiful results have been obtained. In the same year, Mungo Ponton observed the sensitiveness to light of paper containing bichromate of potash. This phenomenon, the true nature of which was explained by Becquerel in 1840, has given birth to the carbon process, the Woodburytype (q.v.), and many others. The world-famous Daguerreotype process was also published in 1839, a film of silver iodide on a plate of silvered copper, being the sensitive material, the pictures on which were developed by the vapour of mercury. This process is still used for making photographs from which accurate measurements are to be taken. In 1850 the art of photography was greatly advanced by the introduction of Mr. Scott Archer's process, in which the sensitive iodide and bromide of silver are held in a film of collodion, on glass, the image being developed with pyrogallic acid, or a ferrous salt. The next great step forward was the adoption of alkaline development for dry plates. The collodion process (q.v.) still holds its own for many purposes, and was universally employed until a few years ago, when the art was once more completely revolutionised by the introduction of gelatine, which may be spread either upon glass or paper, as a medium for holding the sensitive salts. The sensitiveness of these gelatine plates is so great that photographs of express trains in motion, leaping horses, and birds on the wing are of every day occurrence. The application of photography to astronomy has been attended, of late years, with truly remarkable results, for we have now pictures of every object in the heavens, from the nebula in Orion to the spots upon the face of the sun himself. Photographs in colour, upon silver chloride, have been exhibited, though no means are yet known of fixing the results. But upon the solution of this problem, many master-minds are even now at work. phō'-tō-gra-vūre, *s.* [Fr.] A term applied to methods of producing, by photography, plates for printing in a copper-plate press. The processes are kept secret; but, in one of them, the translation of photographic half-tones into the corresponding grain required for printing, is said to be effected by the aid of a substance which crystallizes when exposed to light, the size of the crystals depending upon the amount of light they receive. Such a substance, exposed under a negative, will give a surface, the grain of which will exactly correspond with the lights and shades of the picture, and from which an electrotype can be made for printing purposes.

pho-tō-lĭ-thŏĝ'-ra-phy, s. [Pref. *photo-*, and Eng. *lithography* (q.v.).] A mode of producing by photographic means designs upon stones, from which impressions may be obtained in the ordinary lithographic press. A sheet of suitable paper is coated with gelatine containing bichromate of potash, and exposed under a negative. The surface is then inked with lithographic transfer ink. The paper is next floated, face upwards, in hot water, until the unaltered gelatine swells; then the superfluous ink and soluble gelatine are removed by gentle sponging with hot water. The resultant image is transferred to stone and printed by lithography (q.v.). There are other methods: in some the stone itself is coated with sensitive gelatine; or an exposed sheet of paper coated with gum arabic and bichromate of potash may be damped and transferred to the stone at once. The gum not rendered insoluble by the action of light adheres to the stone. The ink subsequently applied only adheres where there is no gum. Proofs are taken by lithography.

A parallel beam of powerful light is reflected from a silvered diaphragm, and received in a paraboloidal mirror, in the focus of which is a selenium "cell," connected with a battery and Bell telephone. Any sounds which cause the diaphragm to vibrate produce a corresponding variation in the reflected light, which in its turn alters the resistance of the selenium cell to the current from the battery, and so reproduces in the telephone the original sounds.

The model stands, in a studio of special construction, in the centre of a circle of twenty-four cameras, by all of which he is photographed at the same moment. The twenty-four negatives are then projected in succession upon a screen by means of an optical lantern, and the artist goes over the outline of each with the tracer of a pantograph, a cutting tool acting upon a lump of modelling clay, mounted upon a turntable, being substituted for the usual pencil. After each photograph is gone over, the clay is turned through fifteen degrees, and when a complete revolution has been effected, it is removed and finished by hand.

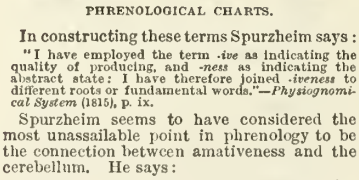
Science: The science or doctrine which teaches that a relation exists between the several faculties of the human mind and particular portions of the brain, the latter being the organs through which the former act. That the brain, taken as a whole, is the part of the human body through which the mind operates, had been from ancient times the general belief; but the localization of the several faculties was first attempted by Dr. Franz Joseph Gall, who was born at Tiefenbrunn in Suabia, March 9, 1757; first promulgated his views in a course of lectures in his house at Vienna in 1796; gained, in 1804, a valuable coadjutor in Dr. Spurzheim; journeyed with him in 1807 to Paris, where a commission appointed by the Institute reported very unfavourably of his system; and died Aug. 22, 1828. When Spurzhcim visited Edinburgh, he met Mr. George Combe who adopted his views, and in 1819 published *Essays on Phrenology,* ultimately developed into his *System of Phrenology* which became very popular. Gall enumerated nearly thirty, Spurzheim thirty-five, mental faculties which he considered as primitive. These Spurzheim divides into moral, or affective, and intellectual. The affective faculties are subdivided into propensities producing desires or inclination, and sentiments, which along with this excite some higher emotion. The intellectual faculties are similarly divided into perceptive and reflective. They were then localized on the brain, or rather on the skull, for phrenology during life can observe only the skull of an individual, and even that with flesh, skin, and hair intervening; and there is not always a correspondence between the form of the skull and that of the brain. The phrenological charts will show the localities of the various organs.

I. Affective propensities—

1. Amativeness; 2. Philoprogenitiveness; 3. Inhabitiveness; 4. Adhesiveness; 5. Combativeness; 6. Destructiveness; 7. Secretiveness; 8. Acquisitiveness; 9. Constructiveness.

II. Sentiments—

10. Self-esteem; 11. Love of approbation; 12. Cautiousness; 13. Benevolence; 14. Veneration (situated on the crown, between 13 and 15); 15. Firmness; 16. Conscientiousness; 17. Hope; 18. Marvellousness; 19. Ideality; 20. Mirthfulness (Wit); 21. Imitation; 22. Individuality; 23. Configuration; 24. Size; 25. Weight and Resistance; 26. Colour; 27. Locality; 28. Calculation; 29. Order; 30. Eventuality; 31. Time; 32. Melody; 33. Language; 34. Comparison; 35. Causality.



PHRENOLOGICAL CHARTS.

In constructing these terms Spurzheim says:

"I have employed the term *-ive* as indicating the quality of producing, and *-ness* as indicating the abstract state: I have therefore joined *-iveness* to different roots or fundamental words."—*Physiognomical System* (1815), p. ix.

Spurzheim seems to have considered the most unassailable point in phrenology to be the connection betwcen amativeness and the cerebellum. He says:

"Indeed, it is impossible to unite a greater number of proofs to demonstrate any natural truth, than may be presented to determine the function of this organ."—*Ibid,* pp. 277, 278.

Dr. Wm. Carpenter brings many facts from comparative anatomy to show that this cannot be the exclusive use of the cerebellum, though he does not commit himself to the view that it is not the function of the central lobe, the two others being connected with the locomotive function. (*Carpenter: Human Physiol.* (1853), p. 758–763.) For some time previous to, and specially since his attack, Phrenology has receded, while less doubtful sciences have rapidly advanced.

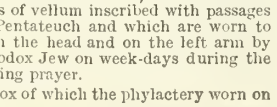
Small square boxes, made either of parchment or black calf-skin, in which are enclosed slips of vellum inscribed with passages from the Pentateuch and which are worn to this day on the head and on the left arm by every orthodox Jew on week-days during the daily morning prayer.

(1) The box of which the phylactery worn on the arm is made consists of one cell wherein is deposited a parchment strip, with the following four sections written on it in four columns, each column having seven lines.



PHYLACTERY FOR THE ARM.

IV.	III.	II.	I.
Deut. xi. 13–21.	Deut. vi. 4–9.	Exod. xiii. 11–16.	Exod. xiii. 1–10.

These are the passages which are interpreted as enjoining the use of phylacteries.

(2) The box of which the phylactery for the head is made consists of four cells in which are deposited four separate slips of parchment on which are written the same four passages of Scripture. On the outside of this phylactery to the right is impressed the regular three-pronged letter *shin* (ש), and on the left side is the same letter consisting of four prongs (שׁ), which are an abbreviation for *Shadai* (שדי) = the Almighty. The phylacteries are generally made an inch and a half square, and have long leather straps attached to them, with which they are fastened to the head and arm. They are worn during prayer and sacred meditation. The hypocrites among the Pharisees made them more than ordinarily large, so that they might be visible at a distance, to indicate that they were praying or engaged in holy meditation. Hence the rebuke of our Saviour (Matt. xviii. 25).

pĭ-ăn'-ō-fŏr-tê, *s.* [Ital. *piano* = soft, and *forte* = strong, loud; so called from its producing both soft and loud effects.]

Music: A musical instrument, the sounds of which are produced by blows from hammers, acted upon by levers called keys. This is probably the most widely-known and generally-used musical instrument in the world. Although slight improvements are from time to time made in its mechanism, it may be described as the perfected form of all the ancient instruments which consisted of strings struck by hammers. Originally the strings were placed in a small and portable box, and struck by hammers held in the hands. In this early shape, known as the "Dulcimer," the instrument can be traced in nearly every part of the globe, and it now survives, almost in its original form, both in Europe and Asia. The dulcimer was also called psaltery, sautrie, or sawtry. The name given to the first instrument with keys acting on hammers was clavicytherium, or keyed-cithara, which was introduced in the fifteenth, or early in the sixteenth, century; next came the clavichord, or clarichord, sometimes called monochord, in which quills plucked the strings; the

virginal soon followed, which was an oblong instrument with an improved form of jack containing the quill; this was soon followed by the spinet, of similar construction but generally triangular in shape; then came the harpsichord, a vast improvement on its predecessors, having a more extended compass and often two manuals. The earliest form of pianoforte, early in the eighteenth century, was perhaps, in some respects, inferior to a fine harpsichord, but it possessed the elements of expansion, as now exhibited in a modern grand trichord pianoforte of seven octaves compass, with every gradation of sound, from pianissimo to a splendid fortissimo, and the most sensitive and delicate mechanism between the finger and the hammer.

The leader of the movement, an Alsatian, Philip Jacob Spener (1635–1705), when pastor in Frankfort, in 1670, was in the habit of holdiug private gatherings in which the Scriptures were explained practically rather than dogmatically, and, this movement spreading, Spener published his *Pia Desideria*, in which he deplored the incessant preaching of dogma, advocated reform in education, and formulated the opinion that a virtnous life was of more importance than a correct creed. After Spener's death the Executive interfered, and proscribed the open profession of Pietism, so that its professors had no opportunity of forming a new sect.

"The principal reforms demanded by the *Pietists*, to be gathered from the writings of their leaders, were these: First, that the theological schools should be reformed by the abolition of all systematic theology, philosophy, and metaphysics; and that morals, and not doctrine, should form the staple of all preaching. Secondly, that only those persons should be admitted into the Lutheran ministry whose lives were samples of living piety."—*Blunt: Dict. Sects*, p. 430.

They are very long-lived; and on the evidence of rings, which in the middle ages were sometimes put in their gill-covers, it has been maintained that some individuals have been captured at the mature age of 250 years. The Pikes are migrants, and have been known to travel overland. The head and back are olive-brown, sides paler, belly silvery white; body mottled with roundish spots, which sometimes form cross-bars on tail. The English name has reference to the elongated form of the fish, or the shape of its snout. This fish is of wide distribution, being found abundantly in the waters of the United States, Asia, and Europe. There are four or five other species, the most notable of them being the *Muskallunge* of our great lakes, which is often 6 feet long, and a "grand game fish." *Esox reticulatus*, the Pickerel of the Eastern States, is a smaller species. The connection between this fish and the shark has been accounted for in various ways; but it is probably a purely selfish one on the part of the pilot-fish, which obtains a great part of its food from the parasitic crustaceans with which sharks and other large fish are infested, and from the small pieces of flesh left unnoticed when the shark tears its prey. The pilot-fish is never, so far as is known, attacked by the shark; but that is probably because the smaller fish is too nimble for the larger one.
